NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

TRADE NOTES.

THE Liverpool (Bank) Telephone Exchange, South John Street, now in course of erection, is from designs by, and under the supervision of, Messrs. Bromley & Watkins, architects, Nottingham. The whole of the constructional steelwork and fire-resisting floors are being carried out by Messrs. Homan & Rodgers, Manchester.

AFTER the coal fire there is nothing which can be compared with the gas fire fitted with Kern tubes, and supplied by the Welsbach Incandescent Gas Lighting Company. No fumes, no smell, and the maximum amount of heat at the smallest possible price should be sufficient recommendation for large or small users. Electric radiators give a certain amount of heat, but in comparison, from personal experience, we are enabled to testify to the advantages still of heating by gas.

IN twenty years the number of machines worked by the London Hydraulic Power Company have increased tenfold, being now more than 6,000. In 1907 they delivered over 19,000,000 gallons through their 160 miles of hydraulic main. The power available day and night throughout the year is 700 lb. per square inch. Among its applications are to motors, hydrants (in which capacity it acts as a powerful reinforcement to the fire engines), automatic pumping gear, ejectors and a vacuum cleaning system. The company's five central stations are at Blackfriars, Westminster, Wapping, City Road, and Rotherhithe, from which they serve a very wide area, including the whole of the City. The street mains are laid at the company's cost, the service pipes being provided at the consumers' expense; but if a three years' agreement is entered into these pipes are laid free. The company make special arrangements to reduce the expense to the consumer wherever possible.

THE Chapel-en-le-Frith R.D.C. have approved a scheme prepared by Messrs. Swann & Brady for the supply of water to the village of Hope, in Derbyshire. The cost is estimated at 4,280*l*.

THE project for the construction of a subway at the Elephant and Castle at a cost of 17,000*l*., as outlined in the General Powers Bill of the London County Council was approved at a public meeting held on Monday at Southwark.

FORESTRY IN QUEENSLAND.

THERE has been considerable progress made in the supervision and utilisation of the forest lands in Queensland, according to the annual report recently issued by Mr. MacMahon, the Director of Forests. Under the Forestry Acts, anyone desirous of obtaining timber on a reserve can have a block of trees marked for him, which will be then submitted for sale by tender or auction, at an upset price fixed by the Land Commissioner, and this is paid as a royalty at per 100 superficial feet on the Crown ranger's measurement. The timber industry has developed, and the revenue from it has steadily increased. Last year, Mr. MacMahon says, speaking broadly and generally, the progress of forestry in the State has shown a very distinct advance. "The permanent reservation of nearly 500,000 acres of areas as State forests marks a very great advance on anything previously attempted in the direction of permanently conserving the timber supplies of the State."

The total area of reserved timber land is 3,672,578 acres. There are seven State forests reserves, a total of 416,872 acres, proclaimed under the State Forests and National Parks Act of 1906. 91,752,076 feet of timber were cut and manufactured during the year in Queensland, an increase over the previous one of 8,950,230 feet. The railway received for the carriage of timber 136,901*l*., and used 91,033*l*. worth of sleepers.

The Government has under consideration the setting apart in perpetuity certain lands as forest lands; for, while good land, contiguous to railways adapted for closer settlement, could not very well be locked up as State forests, yet there are areas that would not pay to cultivate for agricultural purposes, and would never yield more payable returns than the timber they now bear, and these might be conserved for perpetually renewing the supplies.

THE Prestwick Town Council, N.B., have had under consideration a proposal to lay out the land along the sea front from Station Road to Grangemuir Road and to erect a sea wall to protect it. Voting papers will be issued to the ratepayers to ascertain whether they are for or against the proposal. Mr. William Cowie, architect, Ayr, has prepared plans and an estimate of the cost. The scheme embraces the laying out of an area of land extending to about eleven acres. The cost is estimated at about 5,000*l*.

ILLUSTRATIONS.

ST. LUKE'S CHURCH, EDINBURGH.—EXTERIOR—INTERIOR.

HOLBORN TOWN HALL.—PORTION OF FRONT ELEVATION—THE COURT-ROOM.

VARIETIES.

IN our issue of January 8 we included in the list given of the principal contracts let in 1908 one for the erection of a large infirmary and workhouse for the City of London Union at Homerton. The architect for this is Mr. Albert E. Pridmore, 2 Broad Street Buildings, E.C., and not Mr. Stuart Hill, as erroneously stated. Mr. Pridmore has for many years acted as architect to the City of London Board of Guardians. We regret any annoyance our mistake may have caused Mr. Pridmore.

IT is proposed to erect a small public hall in Axminster at a cost of 1,000*l.*

ESTIMATES for the erection of the new higher grade school to be erected at Cowdenbeath, at a cost of 19,000*l.*, were disposed of at a meeting of Beath School Board on Friday.

THE Crompton Council has decided upon an extension of the sewage plant of their works at Newhey, at an estimated cost of 13,500*l.*

THE Birmingham Tame and Rea District Drainage Board have received the sanction of the Local Government Board to loans amounting to 102,717*l.* for works of sewage disposal.

THE Exeter City Council have postponed for a month consideration of a scheme for the extension of the asylum, at a cost of 10,000*l.*

THE plans prepared by Mr. H. Dudley Arnott, architect, Gorleston, have been adopted by the Yarmouth Board of Guardians for alterations at the workhouse.

THE Dundee city engineer has been instructed to ascertain the cost of erecting Corporation district halls in Hawkhill, Blackcroft, and Arthurstone Terrace.

OWING to the isolated condition of the Netherne Asylum, the Surrey County Council have decided to spend 859*l.* 16*s.* for the provision of machinery for engineer's, smith's, and joiner's shops, and making the necessary alterations.

IT has been decided to erect a new church for St. Andrew's, Droylsden, Lancs, in place of the present mission building. The site is on the boundary of Droylsden, Clayton, and Openshaw.

THE infectious diseases hospital of the Portsmouth Town Council is to be enlarged at a cost of 2,000*l.* Application for a loan of 2,300*l.* will be made to the Local Government Board.

THE Newcastle-on-Tyne education committee have agreed to erect buildings in connection with the technical institute at a cost of 6,000*l.* on a site adjoining Rutherford College. It was also agreed to establish a day technical school for sixty boys in the east end of the city.

THE Bath baths committee have decided that plans should be prepared and estimates obtained for the provision of accommodation for the drinking of the mineral waters in the Institution Gardens.

THE Bolton Town Council are recommended by their sanitary committee to direct application to be made to the Local Government Board for sanction to borrow 10,000*l.* for purposes of contribution towards the cost of converting privies or pail closets into fresh-water closets.

THE Widnes Town Council have adopted a proposal to pay the gas and water engineer, Mr. Isaac Carr, a gratuity of 250*l.* for special work done in connection with recent waterworks extensions. Mr. Carr has a salary of 900*l.* a year.

THE South-Western Railway Company have definitely informed the Southampton Corporation of their determination to construct their new dry dock, which, on completion, will be the biggest of its kind in the world, on the Wolston side of the river.

AYR Town Council have resolved to proceed with the extension of the tramways to Hawkhill. The scheme adopted involves the laying of a double line from the new bridge to the east end of George Street, and a single line beyond that to the burgh boundary at the new racecourse, and the estimated cost is 13,614*l.* Parliamentary powers have already been obtained.

published in the Proceedings for the past session, have awarded the "Indian Premium" of the Institution for 1908, of the value of 33*l.*, to Mr. F. P. Anderson, M.Inst.C.E., for his paper on "River Control by Wire Network."

THE Brentford Board of Guardians has agreed to an extension of the nurses' home and the making of alterations to the official and administrative buildings at the infirmary of the union at Isleworth, subject to the expenditure not exceeding 3,395*l.* The Local Government Board has affixed its seal to the plans.

THE Secretary of State for India has appointed Mr. George Bransby Williams to be sanitary engineer to the Government of Bengal. The appointment is for five years. Mr. Williams has since 1906 been consulting sanitary engineer to the Colonial Office, and has done important work for the Government, more particularly in British East Africa.

A NEW preparatory school is being built at Pyrford, Surrey, and will be finished in June or July, ready for the reception of pupils in September. The building will have large and airy classrooms and dormitories, and will be heated throughout with radiators as well as open stoves, and lighted by electricity.

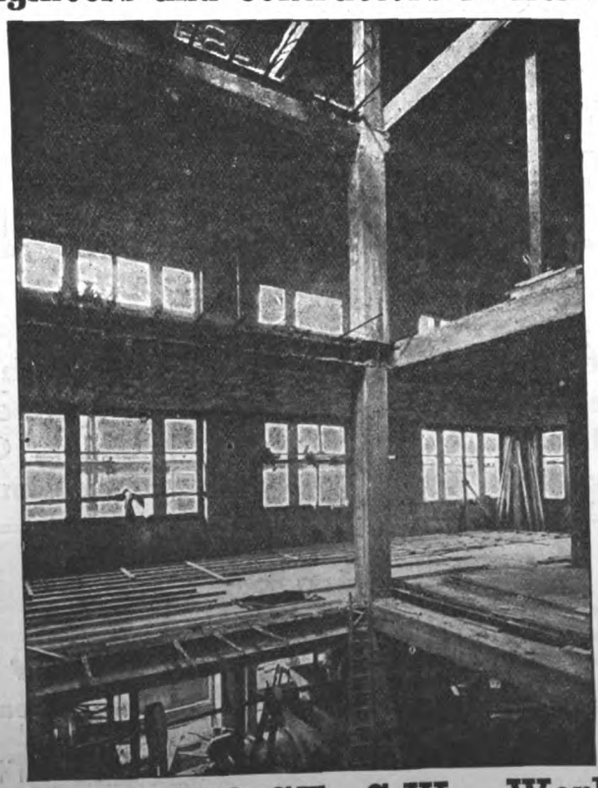
THE Army Council have completed the purchase of four acres of land close to Hither Green Station, for the purpose of erecting a new drill hall and riding school for the 10th and 11th batteries of the 4th London Royal Field (Howitzer) Artillery. Plans have already been prepared for the building, sufficient room being allowed for mounted battery drill in the grounds.

PREPARATIONS are being made in Parkhurst Forest for beginning work on the new prison for habitual criminals decided upon by Parliament last year. Over 30 acres of forest will be appropriated for the purpose of the prison, which will be in the nature of an experiment. The prison proper will be hidden away in the forest behind the existing convict prison.

THE Notts Football Club are negotiating with the City Council for the lease of a new ground between Meadow Lane and the Cattle Market. The scheme drawn up provides accommodation at the outset for from 35,000 to 40,000 people. Provision is made for the erection of a pavilion along the London Road side, a covered stand opposite, another covered stand behind what would be the Cattle Market goal, and a bank at the Meadow Lane end.

THE Hanley borough surveyor has been instructed to prepare a scheme for extending the first-class swimming bath and to obtain tenders for the provision of new private baths at the Corporation Baths. A fire having taken place on the night of the 30th ult. in an upper storey of the town hall, the surveyor was also instructed to examine all the fireplaces in the town hall, and make such alterations as he might think necessary for the safety of the building.

LORD TREDEGAR has informed the Cardiff public works committee with respect to the development for building purposes of his estate on the Penylan side of the Cardiff Railway, that he is willing that the streets should be 70 feet wide instead of 50 feet if the Corporation would agree to 10 feet on each side being set aside for the planting of trees, &c. The part of the roadway to be macadamised will only be the usual width.



THE Derwent Valley Water Board have announced their intention to apply to Parliament for an extension of the reservoir now being constructed. It was formerly anticipated that the water would be supplied in the early part of 1910, but it was now ascertained that wing trenches would have to be made, which would prolong the time of the completion of the work, and it would probably be the spring of 1912 before a supply of water could be given.

THE Galway Harbour Commissioners are considering proposals for the improvement of the port. It is proposed to construct a pier extending in a south-easterly direction for 350 feet from the east quay wall of the entrance to the dock and the deepening of the channel into the dock. The estimated cost of the scheme is as follows:—Excavation of the inner channel, 15,000*l.*; extension of quay wall, 12,000*l.*; dredging outer channel, 3,000*l.*; gates and protecting sea gates, 6,000*l.*—total, 36,000*l.*

THE Homeland Association have brought out a second edition of their shilling handbook, "Where to Live Round London" (northern side). It is a triumph of condensed

information. On two pages is given a general account of the place, of the railway communication with fares and price of season tickets, gas and general rates, subsoil, local authority, recreations, places of worship, banks, schools, and other details important to all thinking of settling away from London.

"THE Beginning of Things" is the title of a remarkable illustrated article in *Harper's Magazine* for this month, by Professor R. K. Duncan, who expounds a fresh nebular hypothesis which is so unlike that of Laplace as to be called by a wholly new name, the "Planetesimal Hypothesis," the authors whereof are to be congratulated upon giving to the world what is believed to be the most dramatic and consistent picture of its genesis that has ever been evolved from the mind of man.

THE Leek Urban District Council held last week a long discussion as to the erection of a wooden building in High Street, to be used as a place of public entertainment. The surveyor, in reply to inquiries, stated he was satisfied with the means of ingress and egress that had been made, and there had been no objections to the construction by inhabitants in the neighbourhood. It was therefore decided that if all sanitary requirements were complied with the Council would not object to the erection of the building.

THE gas manager at Arbroath, N.B., at the last meeting of the Town Council drew attention to the question of additional storage of gas. He had delayed making any recommendation on this subject in view of the possibility of the consumption of gas being diminished by the inauguration of the electric light, but the electric light works had now been in operation for nearly six months and the sale of gas was increasing. He now proposed that a new holder should be provided, of a capacity of 400,000 cubic feet, at an estimated cost of 3,000*l*. The Council instructed the manager to obtain tenders for the work.

THE Staffordshire Territorial Association has approved of the purchase of an extensive area of property from Messrs. Allsopp & Sons, at Burton-on-Trent, for the joint headquarters of the Staffordshire Yeomanry and the 6th Battalion of the North Staffordshire Regiment. The completion of the purchase now only awaits the sanction of the Army Council. The property is that on which stands the Bell Hotel in Horninglow Street. The scheme includes the erection of a spacious drill hall, a four-acre croft for out-door instruction, a riding school, two armouries, and no less than four miniature rifle ranges, together with the usual headquarter offices. The last will be arranged in the hotel proper.

AT a meeting of the Lancashire education committee on Tuesday, it was stated that at the present moment they were prepared to spend 200,000*l*. on new secondary and technical schools—which were already sanctioned—as soon as the higher education deadlock which has existed with the Board of Education and the Local Government Board for over two years was settled. The existing dispute is as to the County Council's desire to become guarantors for non-county boroughs and urban district councils who obtain loans for higher education.

THE joint smallpox hospital committee of the Cannock Rural and Urban Councils having decided to abandon the scheme for erecting a new smallpox hospital at Pye Green, recommended that 85*l*. be paid to Mr. H. M. Whitehead, the architect, this to include all out-of-pocket expenses in connection with the scheme. The present hospital is not suitable, and it was decided to erect a new one, which was estimated to cost about 1,200*l*., but on going into the matter with the authorities it was found that it would cost nearer 4,000*l*. It was therefore resolved that the Urban and Rural Council should join for dealing with all infectious diseases, and erect a new hospital near the present infectious diseases hospital at Cheslyn Hay.

THE York Master Builders' Association have written a letter to the City Council stating they view with considerable alarm and apprehension the renewed proposal to open a showroom for the sale of electricity fittings in the city. The prospect is a very discouraging one and the principle dangerous to all private enterprise. It is submitted that municipal authorities should never place themselves in competition with, or undertake work that will be detrimental to, the private trader. The municipal authorities should not, it is submitted, do more than supply current to the consumer. To undertake the sale and fixing of fittings (invariably at inadequate and cut rate) is unfair to the private traders who are ratepayers, and can only result in their being compelled to close their establishments.

AT the last meeting of the Mexborough education committee Mr. Stewart, of the county architect's office, Wakefield, submitted sketch plans of a new elementary school to be erected adjoining the new secondary school now in course of erection. The school will accommodate 360 scholars at first, but provision has been made in the plans for the addition of four class-rooms when such are needed. It was resolved that the County Council should be asked not to definitely pass the plans until the secondary school governors had been approached as to whether they could not accommodate the elementary scholars.

THE baths and washhouses committee of Paddington Borough Council were recently instructed to arrange for the sale of Queen's Road (Bayswater) baths and washhouses and the site they cover, with a view to the provision of similar premises where they are deemed to be more needed. The committee now recommend the Council to enter into a provisional agreement with William Whiteley, Ltd., for the sale to them of the old buildings and site for 60,000*l*. This is more than the original cost of the baths and washhouses, erected thirty-four years ago, and their site. The provisional agreement is subject to the consent of the Local Government Board to the sale and the application of the proceeds to the erection of new baths and washhouses.

MR. S. RIDEAL, D.Sc., F.I.C., F.S.I., speaking recently at the Royal Sanitary Institute, strongly recommended the application of ozone to the purification of the London water supply. Last year, he said, he examined the installation for the sterilisation of water by ozone at the municipal waterworks in Paris, and from what he saw of the process he considered it a great success. The towns with a river water supply had at present similar conditions to those of Paris and London, and the reasons for ozone treatment seemed applicable to the Metropolis. Many other places whose conditions of supply involved the drawing on wells which might be subject to occasional pollution could by adopting this treatment ensure a guaranteed purity.

AT the last meeting of the Aberdeen Town Council the electricity committee reported that they had considered a circular from the Incorporated Municipal Electrical Association, stating that in the Association's opinion "the time had come when the Institution of Electrical Engineers should again take into consideration the question of their standard wiring rules, with a view to modifying them in such a manner as to admit of the use of a form of wiring which, whilst possessing the necessary elements of safety from fire risk, would allow of a considerable reduction in the cost both of material and labour—a system, for instance, of surface wiring, with flexible conductors mounted on suitable insulators." The committee expressed their concurrence generally with the object sought to be attained, and remitted the circular to the convener and the electrical engineer to adjust the terms of the reply.

THE Woking School Managers, at their monthly meeting held last week, confirmed the minutes of a special meeting in committee, held recently, to consider the scheme of the Surrey education committee for the erection at Woking of a technical institute and boys' secondary school. The site proposed is on the south side of the railway, has an area of 87,527 square feet, and is expected to cost under 5,000*l*. The committee would erect three buildings on the site: (1) technical institute; (2) boys' secondary school; (3) block (hall, laboratory, &c.), common to both. The three need not be erected at once; if thought advisable the secondary school or common block could stand over. No plans or estimates have been prepared by the architects, but the approximate costs are stated as follows:—The whole cost of the scheme, including site and the provision of one building in three blocks (consisting of the technical block, the secondary school block, and the central block common to both), between 20,000*l*. and 21,000*l*. If the technical and the central block alone were provided in the first instance, the cost would be about 9,000*l*.; and the secondary school block alone would be about 7,000*l*.

GAS AND ITS USES.

NATURAL light has been one of the potent influences in the history of architecture. The fierce glare of the Egyptian desert, no less than the mysteries of religion, prompted the erection of cavernous temples on the banks of the Nile. The interior of the Parthenon and other Greek sanctuaries was screened from the Mediterranean sun as well as the vulgar

gaze of the populace. Christianity was founded on other ideals, so that by the fourteenth century, under the constructional genius of the masons, cathedral and church walls had become little more than glass screens.

The present-day architect has quite a new problem to solve, for he must make his buildings as useful by night as by day. With many people their most crowded hours are those passed under artificial light. The importance of this new phase soon produced specialists. But scientific illumination is only a branch of what the illuminating agencies are made to perform. The day has long since gone by when the achievement of domestic gas engineering was limited to a few feeble burners on the ground floor of a building. It is now able to serve a wide variety of highly useful functions. In the kitchen of a well-equipped modern house it provides the means of cooking; the living-rooms and bedrooms are warmed by gas stoves as well as brilliantly illuminated by acetylene; while the bathroom is fitted with a properly ventilated geyser, which is ready for instant use at any hour of the day or night. Or perhaps hot water is distributed from the kitchen throughout the house by a "circulator"—a small boiler heated by gas, which is connected to the flow and return pipes from the coal-range boiler, with which it may work in conjunction or not, as desired. To warm the kitchen a coke-heated water-circulator may replace the coal range and its inevitable pollution of the air by smoke.

The tradition that gas stoves and gas fires are bound to be injurious to health is dying hard. Medical opinion has repeatedly praised them and recommended their adoption; nevertheless there seems to be still a stubborn belief that they are harmful. The chief grounds for this, no doubt, are that they may become so unless properly fixed in the first place, and then cleaned about once in six months by skilled workmen. This attention is after all a small tax compared with the many obvious advantages a gas stove or fire possesses. Two years ago an investigation was published in the *Lancet*, in the course of which it was stated that a properly constructed gas stove, with a flue sufficiently large to carry away the products of combustion, is quite as satisfactory from a hygienic point of view as a coal fire and does not in any way vitiate the air of the room, nor does it produce any abnormal drying effect, as is popularly supposed. It will carry off from about 2,000 to 4,000 cubic feet of air per hour, and this is a valuable ventilating effect.

Complaints are not infrequently raised that certain architects are apt to overlook the more practical details of house construction in their desire to produce something artistic. Drainage, hot water, ventilation, plumbing, and other necessities to a modern residence are sometimes undoubtedly no part of their original schemes. The situation is only saved by the resourceful contractor who covers as best he can the omissions. It is almost a platitude to say that the architect should think of those who are to use a building in the first place, and only in the second of those who may or may not glance at it from the outside. For instance, it is a duty that he should be cognisant of the domestic conveniences that are constantly being created to lighten the work of the householder. These improvements may perhaps be added afterwards; but under such circumstances they can rarely attain their full usefulness. The troubles of the plumber, for example (and incidentally the expenses of upkeep) are multiplied by the lack of foresight on the part of architects whose work shows many afterthoughts. It is rare indeed that we see in a new house proper provision made for the almost indispensable gas stove, or for the other uses to which gas could be put. Yet the far-seeing architect knows that it is on those points that tenants or purchasers lay most stress, and on which turns the answer "Yes" or "No." Well-appointed houses are rarer than one might be led to suppose from the frequent use of that phrase. But it is chiefly due to the culpable negligence of the designers who failed to recognise that buildings are built to be used and not to be looked at.

The financial aspect of gas versus coal is all-important. In the first place it is unhesitatingly claimed that gas is beyond question more economical than coal for cooking purposes, as also in the case of a room which has to be heated for only a short time. It is said that cooking in the ordinary kitchen range might almost be described as "a by-product of wasted heat." In a large household employing some four, five or more servants the abolition of coal fires should mean a reduction in the number of domestics by at least one. Moreover, gas has no injurious effects on carpets, curtains or furniture.

It will be seen that the long and unchallenged supremacy

of coal as the sole manner of heating in the primitive form of open fires is threatened. Gas as a means of lighting has staunch champions, who are confident of its ultimate triumph over all rivals.

REVOLVING DOORS.

A NEW type of revolving door has recently been patented (Buckingham's Patent No. 2,314) by Elliott's Moulding and Joinery Company, Ltd., of Newbury. The illustration shows one as supplied and fixed at the new Welbeck Palace Hotel, Wigmore Street, W., where it gives entire satisfaction. It might here be mentioned that the doors meet all the requirements of the L.C.C. A similar door has been fixed at the Shire Hall, Norwich.

A great point in its favour is the impossibility of it getting out of order. The door works on ball bearings throughout, it is therefore easy to revolve, noiseless in action, dust, draught and odour proof, always open yet always closed. The folding back to admit of bulky packages, &c., is also most easily accomplished by a few turns with a small handle fixed to one of the doors, which are then folded together and bolted top and bottom in one action.

It may be interesting to our readers to know that this revolving door will be exhibited at the forthcoming Building Trades Exhibition in April next, when architects and others are invited to compare its merits with other types on the market. In the meantime catalogues will be sent on application.

Messrs. Elliotts of Newbury are the manufacturers, and are not only patent holders, but are able to quote exceptionally low prices.

The Newbury works have been well known as high-class joinery and moulding works for some forty years past.

WHAT THE PLUMBER SAW.—II.

BY AN OCCASIONAL CORRESPONDENT.

SOME time after the visit of the plumber recorded in our last issue there were a number of happenings in and about the house which proved the forerunners of a complication which made his return inevitable.

It appeared that the child of the house had fallen ill as a result. The sanitary inspector and his assistants had to be called in after the patient had somewhat recovered. On their arrival they stopped the chimneys of the rooms, papered over the chinks of the windows, and made the whole neighbourhood reek with the smell of evaporated formalin. Of course the wily typhosis who was the object of this organised hunt did not try to get up the chimney nor through the chink of the window, for the cavities between the ceiling and the floor or the roof space that had before troubled the plumber were much more convenient hiding-places and quite as secure from the pungent antiseptic. The inspector returned later at the head of another procession reinforced by a wheelbarrow containing an instrument which looked like the combination of a coffee-mill and a machine bellows.

Digitized by Google

The inspector held an open consultation in the back yard, illustrating his points by hieroglyphic sketches made with a walking-stick on the gravelled path. At the conclusion of his summing-up he stuck his stick in the ground, saying there should be a junction or a D.T. here. This was the signal for digging operations, and a gigantic excavation was soon made in the loose-filled earth. As no trace of drain was found there, the perplexities of the inspector began and his look of absolute assurance vanished. A plan of the house had been procured; but the drains shown thereon were only to satisfy the requirements of the building authority, and were obviously impossible as connections to the visible gratings and gullies. After several more trial excavations, which gave the surroundings of the house the appearance of a hastily constructed military entrenchment, it was decided to trace the drain. A commencement was made at a gully intended to receive the water from a diminutive bay window sheltered beneath the overhanging eaves above, on which no rain by any chance could fall. This was unearthed and the coffee-mill cum machine-blower put in operation at the exposed end of the drain. After relays of men had turned the handle of the smoke machine for some hours there was still no evidence of the evil-smelling fumes except in the vicinity of the machine itself It was decided to further trace the drain, so two drain-pipes were taken out; these at once explained the trouble, for the temporary slate stopper had been left in when the drain was laid. This was no doubt one of the contributory causes to the perfection of the test when it was first made by the building authority for the purpose of granting a certificate for habitation.

After this discovery the rest was easy. In spite of the fact that the house had recently been built, the notice subsequently served by the inspector specified that the drains were all wrong and required relaying. Although the draining had been originally apportioned by the architect to the bricklayer, excavator and drainer when the house was built, the owner sent for the plumber to redo the work under the supervision of the sanitary inspector, who combined with his other duties the assumption of sanitary expert.

Consequent upon the general upset and annoyance of the several visits by the sanitary inspector and his return to the house the patience of all the occupants was exasperated almost beyond endurance, leaving little room for toleration to bestow upon the plumber when he arrived to complete the work. This condition of mind fortunately did not unnerve the plumber, who approached the several problems involved with that stolidity which is characteristic of his kind.

The plumber had experience of similar cases, and he rapidly diagnosed the situation without necessity to add to the earthworks the sanitary officers had left. The typed specification of defects supplied by the department conveyed little information of value. The wonder was that it was so limited in detail.

A casual inspection showed that the site upon which the house stood had been originally low compared with the level of the road; and as the architect wished the elevation to be commanding he put in the foundations and issued a general invitation of a shoot for the deposit of rubbish. After such consolidation as this loose earth would receive from the runs of the hod carriers and wheelbarrows, the drains had been laid on a few feet deep of this material and more earth tipped on the top to raise the bank about the house. Of course, they were earthenware pipes without any special foundation. But the joints were well made with Portland cement, though this assisted the pipes to break off at the collars where any settlement took place. They had answered a smoke test previous to being covered up, and when tested afterwards there was sufficient earth on the top to condense the smoke before it got to the surface. Possibly a slate stopper or so left in helped the process.

There was certainly a considerable number of gullies, one wherever a pipe of any size came down to the surface, in addition to several others that received no pipe, but were required to make up the number described in the quantities. To reach these gullies at finished ground level it was necessary to provide a bend and several pipes piled Ossa-Pelion like to reach and support the gully, and to make these more secure they reclined at a slight angle against the wall of the house.

These were some of the details which the plumber saw or assumed in his casual inspection preparatory to devising a scheme to prevent any recurrence of danger from defective or unnecessary drains. Having, with the assistance of a navvy, opened out a few of the drains, he ascertained that most of the liquid, fouled or otherwise (which after negotiat-

ing the gully grate and disconnecting channel had made its way into the drain pipe) did not get far inside, but found a bad joint or broken pipe and filtered into the loose filled earth. This was indicated by its blue-black colour. His surmise was confirmed by an examination of the 6-inch drain near the intercepting trap, which showed no traces that drainage had ever gone so far through.

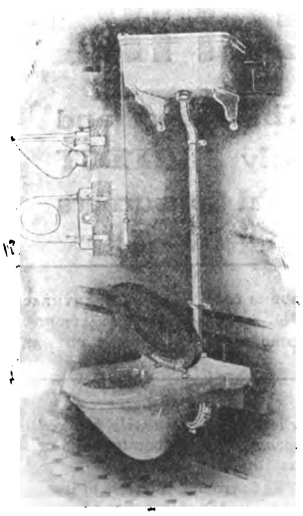
Although these pipes were clear, the stench was abominable as the stopper in the cleaning arm of the intercepting trap was out, having been displaced by pressure of air in the main sewer during a flood, and as there were no vent shafts in the main the air was forced to get through the seal of the trap or blow the stopper out. Possibly it did both. There being no mention of the public sewer being defective in the medical officer's report, the vile condition of this important and possibly most culpable portion of the drainage system was no concern of the plumber's. He contented himself with an endeavour to protect the house against its own drainage being retained long enough to putrify, and left the local authority to look after its own responsibilities.

As previously stated, the ground was bad. To bury the drains at the low and unnecessary level they had previously occupied would necessitate props and wood sheeting to keep up the ground, as well as the removal of earth from the excavation and carting it back, there being no room to stack it safely. The plumber decided to put in iron drains, and commenced with 3½ inch from the intercepting trap manhole, keeping them up to allow him a fall of 1 in 60 to the lowest connection from the house. By using 9-feet lengths of pipe the joints were few on the straight, and these were made with spun yarn and lead well caulked home. By this means the little earth there was to shift could be thrown back on top of the iron pipes as they were laid. He tested the work as he proceeded with air at a pressure of 20 lb. to the square inch, knowing no leakage would ever occur if it stood that; the pipes were strong enough to support their own weight and that of the small depth of earth that covered them.

By the provision of about three inspection chambers with air-tight covers the necessity for any future digging was removed, even if the domestic did put down the soil pipe a few bars of soap, bunches of flowers and mop rags, as these, when the lowest gully overflowed and indicated some stoppage, would be found in the inspection chambers. For the fifteen large gullies which the plumber found he substituted two small ones and brought all the unfouled water pipes to discharge over them without intervening traps, and placed them in such position at the head of drain or branches as to insure their filling the drain to its utmost capacity when the bath was used or a fall of rain occurred. The bath and sink pipes were placed under instead of over the gully grating, and made to flush the gully out every time they discharged, instead of splashing all over the grating and trickling down the inside or outside of the brick eye.

About this time the sanitary inspector called round, and with his stick pointed out that much of the work the plumber had done was not in accordance with the by-laws, and that on no account would he allow a pipe to discharge under a grating. In vain the plumber produced his text-book of elementary science for plumbers' work. The inspector was obdurate; he did not attempt to refute the argument whereby the plumber sought to vindicate his work, but took a firm stand on the by-laws. The plumber knew from past experience and common sense that the by-laws were wrong, and the inspector's interpretation was worse; but officialism prevailed aided by the knowledge that, if a worse job, it possessed potential advantages in the probability of providing another visit later. So the plumber made the alteration to comply with the by-laws.

THE Governors of the Derbyshire Royal Asylum have approved of a scheme for the erection of a children's block. A donor has given 8,000*l.* for the purpose. The governors will endeavour to raise 5,000*l.* in addition to cover the cost of other work involved.



THE Dudley Board of Guardians have received a letter from the Local Government Board, stating that they would be prepared to approve of the plans for the proposed male classification ward and other extensions, subject to certain alterations indicated. It was decided that the plans be amended as suggested, and that the remuneration to be paid to the architects, Messrs. Nicol & Nicol, be a commission of 5 per cent. on the total cost of the works executed.

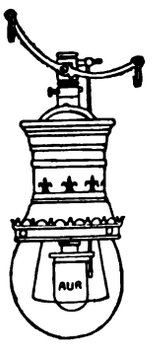
Welsbach
Light and Heat

No. 5119a. This is another pattern of miniature Arc Lamp, specially designed for more exposed Lobby Lighting. Like No. 5120, shown opposite, it is draught and dust proof. Gas consumption, about 4 ft. per hour. Lamp, 80 candle power, price 6s. By-pass 2s. extra.

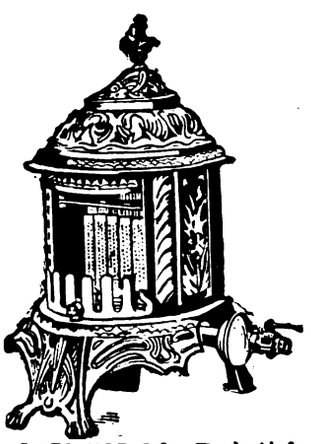


A 70 Candle power Light

British Made

For 3 feet of Gas per hour

British Made



No. 5120. The Welsbach "Aurora" Lamp, an exceedingly pretty miniature Inverted Arc Lamp, draught and dust proof, for Lobbies and Halls, 80 candle power for 4 ft. of gas per hour. Price, Brass, 5s. Porcelain instead of brass body, 5s. 6d. By-pass 2s. extra.

The Welsbach Inverted Burner.

This latest and most artistic design in Inverted Burners, introduced late last season by the Welsbach Company, represents the perfecting of the system of inverted lighting. It is fitted with Welsbach Gas and Air Regulators, which do away with inequalities of gas pressure and ensure a steady light of the true soft Welsbach quality. This burner, guaranteed to be satisfactory, is free from the vexations attending many types of inverted burners, and has already made inverted lighting more popular than ever. It gives more light at less cost than any other type of inverted burner—70 candle power for less than 3 feet of gas per hour.

PRICE: Burner only, 4s. Complete with Mantle and Globe, as shown, 4s. 10½d. Gem size or Bijou size, burner only, 3s.
The Welsbach Mantles for Upright Burners are "C," "CX," and "Plaissetty," 4½d. each. Inverted Mantles, 6d. each.

Welsbach-Kern Radiators for heating scientifically — and economically. —

RADIATOR O.J. Fitted with five tubes; suitable for a room 12 ft. square. Height 17 in., width 12 in. Finished in art black. Price 30s. Top to lift off with boiling ring attachment for kettle, 6s. extra.

The Welsbach Radiators are gas fires with the important difference of being just as cheerful and just as healthy as coal fires, without the dust and without the work. They mark a distinct advance in gas heating, and heat a room more efficiently and at a lower cost than in any other way. They are inexpensive, and last a life-time. Made in 30 models to suit rooms up to 30 ft. square. See also Welsbach "Renown" Gas-heated Steam Radiators, for heating Churches, Institutions, Factories, &c.

The "LANCET" says:

"We doubt whether such an out-put of radiant heat has ever before been attained at so little cost and so low an expenditure of gas. The Welsbach-Kern Radiators give a cheerful, *healthy*, radiant heat, and are remarkably economical."

There is no waiting to burn up. The heat is there quick'y, just when wanted.

Facts and figures about any kind of lighting, and Catalogues and descriptive booklets of Welsbach Light and Heat for all — purposes, will be forwarded post free on application to —

RADIATOR No. O.D. Fitted with five tubes. Suitable for a room about 12 ft. square. Height 16 in., width 14½ in. Finished in art black. Price 30s.

The Welsbach Incandescent Gas Light Co., Ltd., Welsbach House, King's Cross, London, W.C.

... 5, New-street Square, E.C., and Published for the Proprietors by P. A. GILBERT WOOD, at the Office, Imperial Buildings, ... Circus, London, E.C.—*Friday, January 22, 1909.*

THE

Festiniog District Slate Quarry Proprietors' Association

THE Members constituting this Association, whose names are subjoined, beg to notify Architects and the trade that they are the producers of the genuine **Portmadoc Slates,** and would respectfully invite co-operation in discouraging the sale of other, and inferior, slates as such.

¶ The Members will be pleased to supply Acid, Water and Breakage Tests, with full Analysis; also a list of important Government and public buildings upon which their slates have been used during the past 100 years.

¶ Portmadoc Slates contain, according to analysis, only **1** per cent. of lime, whereas the imitation composite slates, now extensively advertised, show much variation; samples recently analysed contain upwards of **40** per cent. of this highly perishable subsiance, and are liable to an absorption of moisture **forty** times as great as that of Portmadoc Slates.

FIBRO-CEMENT COCK BRAND SHEETS AND SLATES
Registered under No. 260,349, January 20, 1904.

PANELLING OF A DINING-ROOM.
The ceiling and panelling of this room, as well as the door casing, mouldings and door panels, are done with Fibrocement.
A panelling of this kind costs less with Fibrocement than if done with wood, as all glueing and assembling is replaced by a simple nailing and the superposition of sheets of various thicknesses.
Compared with wood panels, ours have the great advantage of never "playing" and never giving occasion to numerous joints of paint inevitable with wood panels. Fibrocement never rots. Once fixed to the wall, it in no way loses its shape.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

TRADE NOTES.

ALL manufacturers interested in export business should subscribe to *The Mercantile Guardian*, edited by Mr. Walter Lindley Jones, whose campaign against the fraudulent trader has proved of eminent service repeatedly to merchants engaged in business which has always proved difficult, in consequence of the fact that in most cases exporters do not require commodious offices and a large staff of clerks.

THE Ilford Isolation Hospital has been supplied with Shorland's warm air ventilating double-fronted patent Manchester stoves with descending smoke flues by Messrs. E. H. Shorland & Brother, of Manchester.

MESSRS. JOHNSON BROS., earthenware manufacturers, of Tunstall and Hanley, whose Alexandra Pottery, Tunstall, was recently burnt out, are now having same rebuilt in a more thorough and up-to-date manner. They are also building a new flint mill in Tunstall, their architects in both cases being Messrs. A. R. Wood & Son, of Tunstall and Burslem. The whole of the constructional steelwork, fire-resisting floors and asphalte flats to both jobs are being carried out by Messrs. Homan & Rodgers, Manchester.

A NEW large clock has just been erected in Magdalen College Tower, Oxford, which strikes the hours upon the largest bell of the peal of ten, and plays the Oxford quarter chimes on the other bells. There is no external dial and in some respects it is a copy of the old one. The new clock has been made generally to the designs of the late Lord Grimthorpe and is guaranteed by the makers to keep very accurate time. The work has been carried out by Messrs. John Smith & Sons, Midland Clock Works, Derby, who are also at the present time making a large chiming clock for Selby Abbey, Yorkshire.

BUILDING AND BUILDERS.

THE plans prepared by Mr. D. Edwards, A.M.I.C.E., borough surveyor, Taunton, for the extension of the Taunton Public Library, in Corporation Street, at a cost of 1,500*l.*, have been approved.

THE Great Western Railway Company have decided to erect a new station at Abingdon. The premises were wrecked by a runaway train last April, and have since been temporarily repaired.

THE Shropshire education committee have adopted a recommendation for the erection of a boys' secondary school at Oswestry, to accommodate 120 pupils, at a cost not exceeding 6,000*l.*

ARRANGEMENTS are being made for the rebuilding of the wireless telegraph tower at Machrihanish station, N.B., which collapsed in December 1906, during a gale. The old tower was 450 feet in height at the time of its fall. The company interested is American.

MR. JOSEPH DAVIES, of Woodbank, Mersey Road, Rock Ferry, Cheshire, and of The Cottage, Llanengan, Pwllheli, Carnarvon, builder, who died on September 21 last, aged sixty-six, left estate valued at 49,771*l.* gross, with net personalty nil.

AT the last Coatbridge Dean of Guild Court the Coatbridge Co-operative Society, Ltd., was granted lining to erect a new bakery department in Muiryhall Street, at an estimated cost of 2,300*l.* Mr. M. Brown Russell and Messrs. Penman Brothers were granted lining to erect cottages at Old Monkland and Coatdyke respectively.

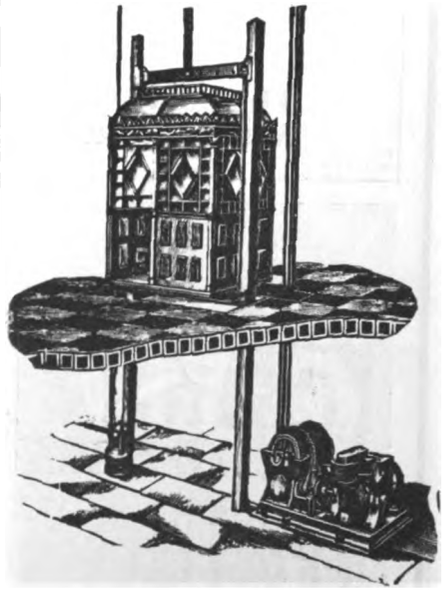
OWING to Torquay Town Council refusing its sanction to a pavilion scheme involving an expenditure of 12,000*l.*, the promoters of the latest proposal, who advocated the erection of a building which, with furnishing, would have cost 9,300*l.*, have dropped the matter. It is understood that it is probable that the Town Council will now again take up the subject themselves.

AN expenditure of nearly 350,000*l.* for the erection of new and the improvement of old buildings was sanctioned during last year by the Wesleyan Methodist chapel committee, whose annual report has been issued. The sum is about 150,000*l.* above the total for an average year. The number of new chapels to be erected is sixty-four, with 10,969 sittings.

THE Southend-on-Sea education committee have decided to carry out extensive alterations and additions to the boys' department at the London Road schools, and have approved of the plans. The extra accommodation will be increased by 131 places, and new cloak rooms and lavatories will be added. Messrs. Cabuche & Hayward, of Westcliff-on-Sea and 18 Eldon Street, E.C., are the architects.

ON July 1 next there are to come into force thirty-two regulations made by the Home Secretary under the Factory and Workshop Act, 1901, for the generation, transformation, distribution and use of electrical energy in any factory or workshop, or any place to which the provisions of section 79 of the Act are applied. Copies of the regulations can now be obtained through any bookseller, price 1*d.*

AT the meeting of the Barnsley education committee on Monday in connection with the new schools to be built in Grove Street at a cost of about 10,000*l.*, a councillor raised the question of the commission to be paid, arguing that 5 per cent. for the construction and 1½ per cent. for the quantities was too much. He thought they should ask the competing architects what lump sum they would take to do it, and eventually he moved that the commission be reduced by 1 per cent., but his resolution had no seconder.



AN experimental line of concrete telegraph poles is now in use on a part of the Pennsylvania Railroad system. It is desired to be independent of any uncertainty as to the supply of wood. According to the experiments made so far, it is thought that a concrete telegraph pole will last for many generations. Importance is also attached to the increased strength of the new poles, which hold the strain of the line, even on curves, without any braces. The poles set up are about 30 feet long, 14 inches in diameter at the bottom and 6 inches at the top.

IN connection with the amalgamation of Lambton & Co. with Lloyds Bank, Ltd., the premises of the latter firm at Alnwick are to be enlarged by the acquisition of adjoining premises lately belonging to the North-Eastern Bank. Internal alterations are to be made, comprising new strong rooms, banking hall, &c., in addition to the provision of two suites of offices and a manager's house. A new front is

RUBEROID RED ROOFING

PAT. NOV. 22. 1904.
A PERMANENT ROOFING WITH A PERMANENT COLOR

Ruberoid Red Roofing

has all the **merits** of the Standard Ruberoid with the added attraction of a rich, handsome colour. This colour will last for years, and is not, like paint, simply a superficial coating requiring constant attention. The **Colour** of Ruberoid Red Roofing is an integral part of the substance of the roofing and, as such, will not wear off.

DO NOT SPECIFY ANY ROOFING UNTIL YOU HAVE SEEN SAMPLE OF RED RUBEROID.

Apply for Catalogue K and Samples.

The RUBEROID COMPANY, Ltd.,
[A2] 81 & 83 Knightrider St., LONDON, E.C.

Digitized by Google

to be erected, the chief feature of which will be an Ionic order embracing the first and second floors. The architect is Mr. George Reavell, jun., A.R.I.B.A., of Alnwick and Morpeth.

THE Master Builders' Association of Ireland held their annual general meeting at the Grosvenor Hotel, Westland Row, Dublin, last week, when the following appointments were made for the year 1909:—President, Mr. James Beckett; Vice-President, Mr. H. M'Laughlin; committee, Messrs. R. Denne Bolton, Thomas Conolly, George Goodfellow, James Kiernan, Thomas Mackey, James Martin, R. E. Mellon and Henry Pemberton; hon. secretary, Mr. John Good; hon. treasurer, Mr. S. Roberts; representative on the Board of National Federation of Building Trade Employers of Great Britain and Ireland, Mr. Richard Denne Bolton; representative on City of Dublin Technical Education Committee, Mr. H. M'Laughlin.

MR. WALTER HILL, of the well-known firm of builders, Messrs. John Thompson & Co., of Peterborough, died on the 17th inst. at the age of sixty-one. He had been associated with the company for over forty years, and became a partner in 1898. With the late Mr. John Thompson, he was associated in restoring the cathedrals of Canterbury, Hereford, Ripon, Chester, Salisbury, Llandaff, Winchester, Peterborough, Lichfield, Lincoln, Rochester, and Bangor; in the building of new churches at Chester and Arklow (Ireland), and in the restoration of St. George's, Windsor; Eton College chapel; St. Michael's, Coventry; and Macclesfield, Ludlow, Bridlington, Holyhead, and Melton Mowbray parish churches. His busy life brought him into intimate connection with architects all over the United Kingdom, and he won the deepest respect of all. He was in harness to the last, dying at Hever Castle, Edenbridge, which was being restored for Mr. W. W. Astor.

THE executive council of the Amalgamated Society of Carpenters and Joiners, in their last monthly report, deal with the decision of the judges of the Court of Appeal with reference to the payment of Labour members from trade union funds. The council remark:—"As for the time being it is ruled by the Court of Appeal to be an illegal act for a trade union to enforce the payment of levies, or use its funds in support of this object, this clearly applies to our own levy of 3*d*. per quarter. We are, however, reluctant to believe that members who are thorough in their desire to promote legislation for the benefit of our class regard this payment as a levy in the sense this term is understood, and therefore would be equally willing to contribute toward this object under any other name. . . . Difference of opinion in our ranks upon this point undoubtedly exists, and must therefore be respected; consequently the enforcement of this small quarterly payment on unwilling subscribers must not be carried out; but for the present we must rely upon the members to honourably fulfil their obligation to the Labour party by voluntarily supporting the movement until such time as the latest decision of our judges against trade unions is either reversed by the House of Lords, or the laws on which this decision is supposed to be based altered, with a common-sense interpretation of our rights." Secretaries and branch officers generally are, therefore, requested to collect voluntary contributions for this purpose from all members willing to assist.

AT the Edinburgh Dean of Guild Court the Caledonian Railway Company were last week granted a warrant to reconstruct the existing bridge over Gorgie Road at Tynecastle, Edinburgh. The new bridge will be of a single span, built on the skew, with a span measured on the square of 52 feet; the abutments will be of stonework, and the superstructure of wrought steel. The new bridge will have a headway of 17 feet from the surface of the road. In connection with the erection of the bridge a temporary bridge will be erected on the east side of the new bridge to carry the railway lines. There will be no interference with the tramway traffic which passes under the bridge.

THE Northampton highway committee will consider at their next meeting the amended plans for the construction of a hippodrome at the corner of St. Giles's Terrace and Abington Street, which are being altered to comply with all the requirements of the Highway Authority. Messrs. Milton Bode & Compton, proprietors of the Opera House, have also decided to build another music hall in the town. Two or three sites are under consideration, and as soon as one has been fixed upon building operations will be immediately commenced.

PATENT

Automatic Fire Hydrant

and COMBINED HOSE REEL.

The only Practical, Reliable, and Efficient Fire Hydrant on the Market, and the Most Perfect Achievement in Fire Engineering.

Water Valve Opens Automatically

Can be instantly operated by any unskilled person

Can be worked by Women & Children

Has been installed by:—

VARIETIES.

THE Dundee water committee have adopted the recommendations of their engineer with regard to laying down new conduits at a cost of 4,977*l.* for the improvement of the Broughton water supply.

ORDERS have been given for the construction at Lorenzo Marques of a stone quay over 4,500 feet in length. It is to cost about 310,800*l.* Authority has been given for the purchase of the materials for beginning the work.

IT is proposed to expend 8,475*l.* on the erection of a new county school for girls at Winchester, in addition to the cost of the site which the county authorities had previously secured from the Ecclesiastical Commissioners.

MESSRS. ERNEST RUNTZ & FORD announce that they are removing their offices from Walbrook as and from February 1, to 62 Victoria Street, Westminster, S.W., and that their telephone number will be 7924 Gerrard.

THE Swansea Town Council last week discussed the question of the provision of a new training college, but the matter was adjourned for a special meeting. It is estimated that the cost will be about 45,000*l.* It was pointed out that the Council will shortly have to face the provision of an asylum and three additional elementary schools.

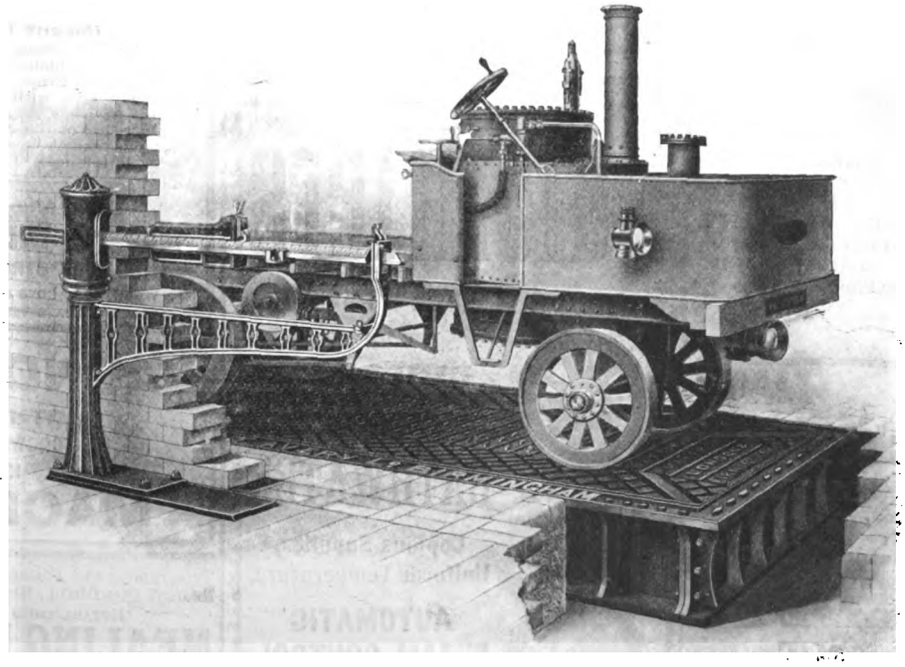
THE Local Government Board have sanctioned the borrowing by the Rugby Urban Council of 4,200*l.* for the purpose of erecting and equipping public baths on a triangular piece of land near the centre of the town, in Regent Street. The application for the loan was made in November, and the inquiry was held in December.

A PUBLIC meeting was held at the new Muncipal Buildings, High Holborn, W.C., on Tuesday, in connection with the proposed reconstruction of Holy Trinity Church, Kingsway, at a cost of 8,000*l.* The church has been closed as a dangerous structure in consequence of recent excavations.

MR. JAMES KINNIBURGH, contractor, Glasgow, has received the contract for the cutting of a part of a trench in connection with the new Clydebank waterworks. The length of the trench is five and a half miles, and the contract includes the cutting of a tunnel 700 yards long. The contract price is a little over 12,000*l.*

THE Paddington Borough Council have adjourned the discussion of a recommendation to sell to Messrs. Whiteley, Ltd., the freehold site and buildings of the Queen's Road public baths for 60,000*l.* William Whiteley propose to erect an extension of their premises thereon at a cost of 250,000*l.*

THE Local Government Board has refused to sanction the scheme submitted by the Sheppey Rural Council, under which it was proposed to spend nearly 7,000*l.* in draining the parish of Minster. They suggested a modified scheme to meet the present needs of the parish. The Chairman of the Council says that the scheme would have been of great service in the development of land on which plots to the value of 75,000*l.* have been sold.



MR. A. G. DRURY held a Local Government Board inquiry on Tuesday, into an application by the Manchester Corporation for sanction to borrow 59,443*l.* for the purpose of extending the bacteria beds on the Davyhulme sewage farm. The sum of 45,943*l.* is required for the construction of second contact beds, and a further sum of 13,500*l.* for the provision of granite in lieu of clinkers for filtering purposes.

A SCHEME has been prepared for developing a part of the Alkrington estate as a garden city suburb. The estate is between Middleton and Manchester. A scheme is being prepared for the lay-out of the property by Mr. Thomas Adams, late secretary and manager of the Letchworth Garden City. A resident agent has been appointed, and the work of preparing the plan is being proceeded with. It is hoped to start next summer, and to form a co-partnership society to develop part of the estate on the lines suggested.

THE Bridlington Town Council have passed a resolution that application be made to the Local Government Board for sanction to borrow 10,670*l.* to erect and furnish new public elementary schools in the Old Town Ward in place of the Priory Church schools, condemned by the Board of Education.

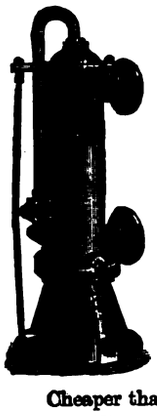
MR. R. RILEY, surveyor to the Wellington Rural District Council, has been instructed to prepare a scheme for the erection of public swimming baths. He has also been instructed to prepare the necessary specifications for carrying out a scheme of street paving, &c., in the town, for which the sanction of the Local Government Board in regard to a loan has already been granted.

THE Burslem Town Council have instructed the borough accountant not to accept any certificates for work done by any contractor unless they are accompanied by a covering note stating that the policy of insurance of workmen had been inserted by the town clerk. No contractor will be allowed to continue working who has not produced a policy of insurance.

THE Hull allotments committee at their last meeting discussed the conditional offer of Mr. Christopher Pickering, trawler owner, to sell the Corporation land fronting Hessle Road and Mill Lane for the purposes of allotments and a park. The area is 154 acres, and of this Mr. Pickering was prepared to give 34 acres to the Corporation, provided they purchased the remaining 120 acres at 400*l.* an acre, which represented a cost to the Corporation of 48,000*l.* Mr. Pickering also offered to erect twelve cottage almshouses, at a cost of 4,000*l.*, and to leave the election of tenants to the Corporation. The offer was accepted.

THE works and general purposes sub-committee of the Southampton education committee last week reported that they were unable to obtain the temporary services of a quantities surveyor for the preparation of bills of quantities in connection with the alterations and additions to Ascupart and Western District schools, except at a cost of over 200*l.*, and that the assistant borough engineer and other assistants in the borough engineer's department having offered their services, after office hours, to carry out the work, such services were accepted. A grant of 50*l.* will be made to the assistant borough engineer and those who assisted him for extra services rendered.

A HOUSING scheme on co-partnership lines is being promoted at Hereford. The site is near Barr's Court railway station, and is being laid out on town planning lines by the Hereford Town Council, who are demolishing an area of slum property in the centre of the town. The site is being developed, including the purchase of the land, at an estimated cost of 2,300*l.* A proportion of houses will be built at rents suitable for men earning from 18*s.* to 20*s.* per week, and others for men earning up to 30*s.* per week. There will be not more than twelve houses to the acre, and gardens or allotments will be provided.



AN inquiry was held at Birmingham on Wednesday into a proposal by the City Council to extend the city boundaries. If the proposed scheme is carried out Birmingham will possess an area of 39,089 acres, with a population of 874,837, and would be in area and population the second largest city in the kingdom. The districts proposed to be included are Yardley, with a population of 58,000; King's Norton and Northfield, 78,608; Handsworth, 68,051; Aston Manor, 82,000; and Erdington, 29,250. Practically the whole of the area is within a radius of five miles of the Council House, and the land within a four miles radius is either completely built upon or is in a forward state of development.

MR. J. G. MACSWEENY, Local Government Inspector, last week concluded an inquiry at Mallow, Ireland, with reference to an application by the District Council for the erection of 229 cottages and the provision of seventy-five additional allotments at an estimated cost of 43,120*l.* The Inspector, in the course of the inquiry, commented strongly on the failure of the District Council to complete the last scheme, and suggested that a way out of the difficulty might be found by adopting a system of direct labour, and appointing a clerk of works to complete the scheme. Such a plan would probably offer a more economic means of reaching the desired end. The cost of the cottages was too high; in most parts of Ireland it was probably 10*l.* to 20*l.* less, and he could not see why the Mallow Council could not make an effort to keep within the standard laid down by the Board.

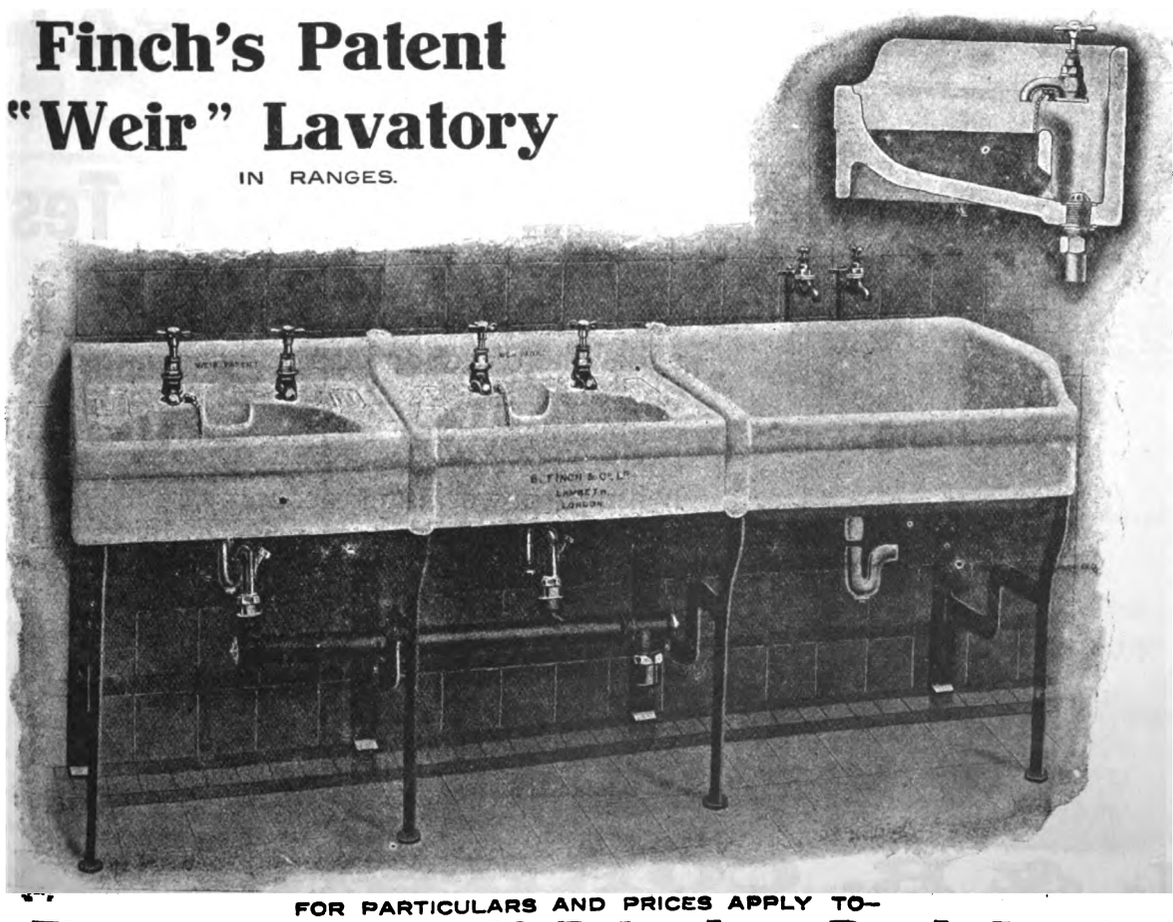
YEAR BOOKS.

LOCKWOOD'S "Builder's Price Book for 1909" needs no better recommendation than to say that it is as excellent as its predecessors. When a work of this kind has reached maturity there is little room for marked changes from year to year. It is only possible to make minor revisions. In preparing the latest edition regard has been paid to any alterations in prices of labour and material. The preface says:—"These changes have not been very emphatic; but, for instance, the cost of bricks is, on the whole, lower than last year, and the same may be noticed in regard to lead." Thus the price given in last year's "Lockwood" for hard stocks and roughs per 1,000 was 2*l.* 5*s.* and 2*l.* respectively; in 1909 it is given as 2*l.* and 1*l.* 10*s.* One of the principal additions in the book is a note issued some months ago by the London County Council relating to means of escape under the London Building Act, 1905. This has been inserted in the Supplement, which deals in great detail with the parliamentary enactments relating to buildings in London.

It would be highly instructive to compare the ninety-second edition of Laxton's "Builders' Price Book" (Kelly's Directories, Ltd.), which has just been issued, with the original production of William Laxton. The 1909 edition is enlarged to the extent of an extract of the London County Council General Powers Act, 1908, as to the cubical extent of buildings. The valuable introductory note showing a method by which an approximate estimate of the proportion which labour bears to material may be calculated, is reprinted. The care with which the book has been produced bears out the statement that "the various prices have received careful attention, and where necessary, owing to the decline in the price of materials, the items have been duly adjusted." We might remark that the similar paragraph in the previous edition said "owing to the *advance* in the price of materials." The volume still can cause pleasure by the orderliness of its contents, which include everything that can be wanted by architects, builders, engineers and contractors.



THE London Master Builders' Association have issued their diary and handbook for the current year, and as before, it includes a short glossary of electrical terms. It amply fulfils its avowed purpose of providing useful information for those actively engaged in building operations throughout the Metropolitan area. There are the same excellent series of tables.

"The Local Government Annual and Official Directory" must now have become almost indispensable to all officials of public authorities and to the public authorities themselves. It has the *imprimatur* of official correction, and has been edited by Mr. S. Edgecumbe Rogers. It is thoroughly up to date and gives an abstract of seven statutes passed in 1908 dealing with local government. The Old-Age Pensions Act is quoted at length. The first portion of the contents refer to London, and the second to the country.

MRS. D'OYLY CARTE has revived the glories of the Savoy Theatre. Plays like "The Gondoliers," "The Pirates of Penzance," "The Mikado," and "H.M.S. Pinafore," are too good and too popular to permit a question of doubt as to the advisability of again placing them before the public. The well-filled theatre at these performances is at any rate sufficient testimony to the popularity they enjoy; if further proof should be required, a visit will afford this. The hearty laughter from stalls, dress circle, pit and gallery is almost as enjoyable as the play itself. "The Gondoliers," perhaps, is the most popular, and with an excellent company and Mr. Rutland Barrington the intense interest and excitement is maintained from start to finish. A card may be obtained giving the name of play and date up to Saturday, February 6, on application at the theatre.

THE education committee of the Hampshire County Council have recommended that the County Council should be asked to approve the expenditure of 11,169*l.* on the erection of a new Council school at Eastleigh, and apply to the Local Government Board for sanction to borrow the money. The expenditure of 9,365*l.* for a new Council school at Farnborough was also recommended.

TECHNICAL EDUCATION.—II.

By WILLIAM CHALLONER, President of the Institute of Plumbers.

(Continued from January 8.)

[IN the first instalment a very brief résumé was given of the history of technical classes before and immediately after the Technical Instruction Act of 1889. This Act proved to be a failure for the classes were attended by a quickly diminishing number of students.]

In some exceptional cases the classes were equipped and the teachers appointed by a committee who possessed little or no knowledge of the practical needs of the crafts intended to be taught, nor the value of such qualifications as the applicants for positions as teachers possessed.

The idea of any necessity to obtain the advice or assistance of a responsible organisation of employers, where one existed, or of persons engaged in any particular trade does not appear to have suggested itself, with the inevitable result of alienating an interest that was most essential for success.

Many of the syllabuses were compiled by authorities whose object tended in the direction of qualifying teachers and not craftsmen, and as the standard of practice varied considerably in different parts of the country, it frequently occurred that the principles taught in the schools bore but a slight relationship to the local practice in their application, and in not a few cases were directly opposed to them.

It is not unusual to still find a teacher who possesses the highest certificate for teaching a subject having a most elementary practical knowledge of the craft he essays to teach. They frequently follow quite another occupation in their ordinary employment or have long discarded any practical association with the subject. Notwithstanding these anomalies students persevere tenaciously throughout a course, and obtain certificates of efficiency in a trade or craft, though only in the way they are taught in that particular school. Unfortunately these certificates do not possess their intended value, and rarely secure either preferential employment or additional remuneration for the possessors of them. They are frequently of value however in obtaining an inspectorship; but in such cases there is no gain to the particular trade or craft the educational process was intended to benefit. Whilst we have no wish to deprecate the training of inspectors or their necessity, even if the system of education for craftsmen was much more practical and perfect, it is obvious that the number of inspectors might be curtailed and some economy effected if the individual workman was trained on right lines and permitted to carry out his work according to those principles.

For these and other reasons which may have a more or less local character the interest in technical schools is extremely half-hearted, and the attendance consequently is meagre and irregular. The students who attend without some compulsion on the part of either the parent or the employer are becoming more and more a rarity—they do not see the good of it. To serve as a counter attraction to cheap amusements and popular games its advantages must be made more apparent and immediate. The means of inducing the students to try the experiment, are limited, and none exist to compel their attention even if their attendance is somehow secured. As a result the attendance throughout the country is not more than 10 per cent. of those who might be expected to avail themselves of the classes. This indifference cannot be condemned as wholly inexcusable so long as the system can only offer such doubtful resultant advantages.

During the past few years one or two national organisations of employers (and in one case with the co-operation of the workmen's trades union) have endeavoured to render assistance to those authorities who exercise a control in technical education by approving the qualifications of teachers, conducting examinations and granting certificates. This assistance met with courteous approval. But in spite of the cost and sacrifice of time entailed upon the members it has failed to effect any real improvement. It certainly emphasised the many difficulties and anomalies existing, and showed that until these are brought into line it is useless to hope that the present system will attain the realisation of its ideals—at any rate in so far as the trades under notice are concerned. This is so because in no trades or crafts are the difficulties so great or the anomalies so marked as in those connected with buildings. The leaders of this movement are convinced that if they are to put the system upon a better basis, a system of sequence must be established from the elementary schools to continuation

THE "DRAWWELL" GRATE

WAS PLACED

First in the Final Tests

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjurction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public and private buildings.

N.B.—All Grates bear the Trade Mark and Name of "Drawwell" on firebrick to insure against imitation.

This Grate can only be supplied through Builders' Merchants, Ironmongers, &c., but Drawings and Particulars can be obtained from

Digitized by Google

schools and onwards to completion by a course at the technical schools. It is also imperative that the system of indentured apprenticeship should be resuscitated in order that compulsory attendance of the apprentice may be ensured, and by this means technical education may be made to supplement workshop training instead of attempting as it does now to supplant it.

There would appear to be a weak point in our national educational system, the adverse effects of which are by no means restricted to those who try to learn a trade in connection with building. Upon its remedy the success of all attempts to get the best value from technical education will to a less or greater extent depend. Under our elementary school system the State has control over the student in so far as it compels his attendance to about the age of fourteen, or until a certain standard of the code is passed. But there is no control afterwards, except such as the parent may elect to commence, and which being thus delayed is not always effective. This control of the State, however slight, is discontinued at an age when some degree of authority is most necessary if the adolescent is to be inculcated with those habits of discipline upon the acquisition of which the future will largely depend. If this control could compel attendance and attention at continuation schools, and beyond that to the technical schools, until say the age of eighteen, there would be a hopeful prospect for the disappearance of one difficulty that mars the success of the movement.

The direct effect of filling the interregnum between the elementary school and the specialised technical course by attendance at continuation schools would ensure that the habit of study was not completely lost, and the superficial knowledge acquired of the multitude of subjects which go to make the present elementary code would not be allowed to evaporate. In addition, continuity in study would remove a difficulty with which all technical teachers have to contend in reinstructing students in those general elementary subjects which are indispensable, and that find their application in the special subjects of the technical classes. It is unnecessary to point out that a teacher who is at best only trained to give instruction in special subjects is not often qualified to take the place of the schoolmaster or teacher of pure science. His time ought to be better occupied than in teaching those subjects which, when forgotten, may be learnt better and more economically elsewhere.

The condition of mental unreceptiveness of the great proportion of students attending evening classes is also a matter which demands attention. There are usually considerable distances separating the workshop or building from the home, and again from the home to the school where the classes are held. A typical case of a student may be taken, who has been on a building or in a workshop all day, and leaves work at say half-past five. Between that time and seven o'clock (the usual time the classes commence) he must go home, wash, probably change, get his evening meal, and cover the distance that lies between his home and the class. All this in 1½ hours. The student has perhaps been in the cold all the day; the warmth of the class-room added to the often rather humdrum lecture of the teacher, makes it extremely difficult to keep awake; consequently the requisite keen attention, especially in theory classes, is quite out of the question. The remedy for this is that the employer should arrange for those of his apprentices who are attending technical classes to leave work earlier on those nights. Sufficient interest, however, will not be excited to induce such a sacrifice until the employer is better satisfied of the ultimate value of the technical schools, not to himself alone, but to the future workman, if he remains at his trade.

These criticisms by no means exhaust all that can be advanced against the existing system of technical education in so far as it affects the building and allied trades, and there is reason to suppose that they can be equally well applied (in whole or part) to many other trades and crafts not directly concerned in building.

As stated at the commencement of this article, commercial conditions are not favourable to higher technical training. This most important factor does not appear to have been understood, or, if so, not considered at its value by the idealists who sought to solve the problem of foreign competition and unemployment by this means.

Technical education in the building trades, if it falls short of all else, teaches that the best material and tools, together with a reasonable amount of time, are required in the execution of work. The classes are well equipped, so far as they go, and the work is accomplished under conditions

GREEK MARBLE.

MARMOR LIMITED, 18 FINSBURY SQUARE, E.C.

Digitized by Google

that do not demand the exercise of that ingenuity on the part of the workman which is more or less inseparable from his actual work. It is often impossible to carry about a well-equipped set of tools, and therefore the efficiency of the work depends as much upon the ingenuity of the workman in the adoption of makeshifts as his technical training.

The well-designed or adapted materials, and the additional time which higher efficiency demands, have a peculiar interest to the employer, in so far that too frequently reputation and efficiency were not the deciding factors which placed the work in his hands, but the lowest tender. It is needless to say that there are difficulties in providing an equation that will fit efficiency and minimum cost to enable the contractor to price his work and come near the lowest. It may be advanced against this that reputation has some influence in the decision whereby contracts are placed. But a casual notice of lists of tenders will show that such influence is inconsiderable when placed against the lower cost. It is usual, except in the case of a well-known firm, to make inquiries as to the position of a contractor before placing any work with him; but these inquiries are generally confined to his financial position or his ability to execute the job in a short time in order to make up for the time wasted by the architect in preparing plans, or the indecision of the owner in approving them.

Numerous cases have occurred where the knowledge that the applicant for employment possessed a certificate from a technical school has prevented his having preference, the answer being "this is a cheap job and we cannot afford to employ highly-trained men." There have been a few exceptions in at least one department of the building trade, where employers have been able to withstand the financial strain which a refusal to compete at the lowest prices entailed, and who are still holding out in the expectation that some of these anomalies may in time be adjusted.

It is rather remarkable to find that the greatest eagerness for cheap work, and the greatest disregard for reputation and efficiency is on the part of public bodies. They are frequently found to be enthusiastic in one department of their administration, for greater efficiency through higher education, and yet are the keenest advocates for cheap work when they have contracts to decide. Amongst these none cry out louder for cheapness than the so-called representatives of labour, who in the commencement clamoured for free educational facilities to be provided for the advantage of their class, and who have since been either opposed or at least completely indifferent to any endeavour to assist in its success.

THE Factory Department of the Home Office issued on the 16th inst. a memorandum as to the use of water gas, suction gas, and other gases in factories, containing information of an important character regarding carbonic oxide poisoning, and recommending precautionary measures. The Department calls attention to the fact that in recent years there has been great extension of the manufacture and use of water gas and other gases of a similar nature for many industrial purposes. The particular danger associated with all these gases is that of poisoning by carbonic oxide, which isalso a constituent of ordinary coal gas; but whereas the proportion in coal gas varies from 4 to 12 per cent., in carburetted water gas it reaches 12 per cent., and in uncarburetted water gas 50 per cent. The annual reports of the Factory Department during the last eight years show a steadily increasing number of reported cases of poisoning by carbonic oxide on manufacturing premises. Thus in the five years 1899 to 1903 there are references to fifty-one cases, of which seventeen were fatal; in the two years 1904-5 to fifty-seven cases, of which eighteen were fatal; and in the two years 1906-7 to 136 cases, of which fourteen were fatal. The lessened mortality was due possibly to better knowledge of the methods of resuscitation. Instructions with regard to starting, stopping, charging with coal, testing, cleaning, and repairing are recommended to be posted in the engine-house, and certain structural conditions of general application are set out as precautionary measures with a view to the avoidance of unnecessary risk. The inspection of valves and connections at stated intervals by a competent person, to see that no leakage is taking place, is also recommended. The Department also suggests the provision of ropes for rescue purposes, and that further notices should be affixed in the works explaining the deadly nature of the gas, the symptoms of poisoning, and the means of rescue and "first aid."

THE INDUSTRIAL DEVELOPMENT OF EDINBURGH.

AN element of prosperity which has hitherto been associated primarily with the capital of the West is to receive more attention than in the past in the case of Edinburgh. The Scottish capital's advantages as a show city, as a centre of education and as a place of residence for leisured and retired people are well known. It is possible, says the *Scotsman*, that these considerations may have overbalanced other elements of communal prosperity to their detriment. The town clerk, acting on instructions from the Town Council and the Lord Provost's committee, has drawn up a document dealing with the advantages of Edinburgh as a site for factories and other public works and other relative matters.

"Her face is her fortune," observes the town clerk, in his preliminary memorandum, is a phrase often applied to the city. Its rapid development and progress in recent times, he observes, however, prove that Edinburgh is not resting upon the traditions of the past, however great these may have been, but is keeping its place among the progressive cities of the present day. In certain aspects, however, the advantages of the city are not so fully realised as they ought to be. It is too readily assumed that the distinctive attractions and amenity of the city are inconsistent with the extensive establishment of industrial works, or that there is an absence of the resources and conditions which are requisite in the site and successful prosecution of such works. It is desirable to clear away misconception on the subject There is no reason why the prosperity and development of the city should be confined to lines which exclude the extensive establishment of manufactories or industrial enterprises. Instead of being devoid of the special requisites for these latter, Edinburgh is well endowed with them, and there is no reason why there should not be a great increase in industrial establishments without in any way interfering with or detracting from its characteristic amenity and attractions. The late Sir George Harrison, a former Lord Provost, when asked what was the leading industry of the city, replied "Education." That still remains true; but while there has been a vast increase in the educational institutions of the city in recent years, the actual extent to which industrial pursuits are already carried on is very apt to be under-estimated; and it is to be feared that the degree in which the requisites of successful industrial works are to be found in Edinburgh and its neighbourhood is very inadequately realised.

Included in the memorandum is a table showing the numbers employed in the principal trades in Edinburgh and Leith, according to the census of 1901. The building trades are easily the first, the total number of men employed being 13,175 in Edinburgh and 2,308 in Leith. The quantity of coal available is abundant; the quality is excellent; and the price, delivered in Edinburgh, is moderate, and will compare favourably with other manufacturing centres.

Edinburgh's railway facilities are enumerated. It has sometimes been said that Edinburgh could not be a large manufacturing centre owing to the absence of a navigable river. This, however, overlooks the fact that the city has direct and immediate access to the Firth of Forth, one of the best waterways which could possibly be had. The access to the firth by the harbour and docks of Leith is convenient; and the facilities for business at that port are already very extensive, and with the adjoining harbour at Granton they are capable of extension to any degree required by the increase of trade. There are thus open to manufacturers in Edinburgh facilities for transport by water to and from the ports on the east coast of Britain or on the Continent, to say nothing of more distant places.

Edinburgh has long been noted for the large number of persons who possess capital, and place it on deposit, lend it to public companies or otherwise invest it. There is really an unlimited field for raising capital if the security and prospects of the borrower are satisfactory. There is always a large number of business men who would form eligible directors for public companies of good standing. As the headquarters of the large Scottish banks and insurance companies Edinburgh, in a financial aspect, has great advantages for the development of industrial enterprise. With regard to sites available for industrial works, it is pointed out that there are many such sites in Edinburgh, where the establishment of works would not in any way injure the amenity of residential parts of the city—for instance, in the sites at Gorgie (belonging to the Corporation), Trinity Hospital lands, Craigentinny and Granton. It would no doubt

be a misfortune, it is observed in the memorandum, if anything should be done which would diminish the present attractions of the city; but an examination of the eligible sites, in their relation to the residential parts of the city as shown upon the map, or to anyone acquainted with the locality, will, it is believed, show that no detriment need be feared from even a large increase of factories and works in those parts of the city designated as eligible for them.

These works would necessarily bring capital to the city, which would be utilised in the employment of labour, not merely in the building and allied trades for the erection of the works, but in the employment of operatives to carry on the various industries for which the works are intended. The presence of skilled and fully employed operatives necessarily involves the usual provision of dwelling-houses and all the services and numerous trades which are bound up with the prosperity of the community. In this direction may be sought the real remedy for the unemployment which is so rife at the present time. Much of the effort and expenditure now directed towards measures of relief of the unemployed in methods necessarily temporary and palliative, but not forming any real remedy, would be dispensed with. Additional outlets for capital, increased demand for labour of all kinds and the production of manufactured goods, with the consequent distribution of money in the community, would imply increased prosperity and development of the city. The new Art School, the efficient and growing technical training given by the Heriot-Watt College, the well-equipped University, the other vast educational agencies and the skilled artisans in the workshops throughout the city, might be expected to furnish a constant supply of well-trained and highly skilled employés, adequate for the demands of a great development of industrial activity in all directions. All classes and interests within the city would benefit from such a development of industrial activity as is now desired, while leaving uninjured the existing agencies and resources of the city.

By the passing of the Patents and Designs Act, 1907, a new opportunity has been provided for attention being drawn to Edinburgh as an industrial and manufacturing centre. By that Act, which was passed on August 28, 1907, it was provided that after the month of August 1908 patents registered in the United Kingdom which have been in force for four years might be revoked if the patented article or process is manufactured or carried on exclusively or mainly outside the United Kingdom. The patentee requires to show that his process is "manufactured or carried on to an adequate extent in the United Kingdom" or give satisfactory reasons why it cannot be so. The effect of this provision is that foreign inventors—and how numerous these are on the Continent and in America is well known—will lose the benefit of their patents within the United Kingdom unless they establish works here and carry on the manufacture in an adequate degree. Hitherto they have had all the benefits of a patented process, and carried on their manufactures abroad for sale within the United Kingdom. It follows that there must be a very large number of such persons who will have to look out for suitable sites in this country. This therefore provides a new and probably extensive—no one can say how extensive—opportunity to approach such persons and press upon them the claims of Edinburgh as a site for their purposes. Of course, the same means which may be taken to inform these foreign inventors of the position of Edinburgh in this matter might result in bringing it before the notice of persons throughout Great Britain.

The Town Council, it is suggested, might take steps to procure definite and accurate information bearing upon the requisites of eligible sites for manufacturers, and showing how far these are to be found in Edinburgh; details as to the sites which are in the market available for the purpose, and the rates or prices at which these are to be had, and to disseminate such information in an accessible form throughout Great Britain and in foreign countries. The co-operation of the railway companies, the Leith Dock Commissioners, the coalowners in the neighbourhood and the owners of land may be invited. Accordingly, if the Town Council approve of taking action in this matter, it is suggested that they should remit to the committee, with power to confer with these parties, to obtain such information and present it in a convenient and accessible form, with appropriate maps or tables, and to take steps to circulate the same extensively in quarters which might be deemed suitable.

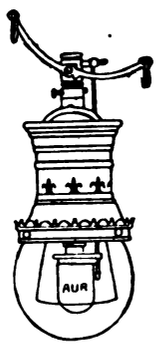
Welsbach
Light and Heat

No. 5119a. This is another pattern of miniature Arc Lamp, specially designed for more exposed Lobby Lighting. Like No. 5120, shown opposite, it is draught and dust proof. Gas consumption, about 4 ft. per hour. Lamp, 80 candle power, price 6s. By-pass 2s. extra.



A 70 Candle power Light

British Made

For 3 feet of Gas per hour

British Made

No. 5120. The Welsbach "Aurora" Lamp, an exceedingly pretty miniature Inverted Arc Lamp, draught and dust proof, for Lobbies and Halls, 80 candle power for 4 ft. of gas per hour. Price, Brass, 5s. Porcelain instead of brass body, 5s. 6d. By-pass 2s. extra.

The Welsbach Inverted Burner.

This latest and most artistic design in Inverted Burners, introduced late last season by the Welsbach Company, represents the perfecting of the system of inverted lighting. It is fitted with Welsbach Gas and Air Regulators, which do away with inequalities of gas pressure and ensure a steady light of the true soft Welsbach quality. This burner, guaranteed to be satisfactory, is free from the vexations attending many types of inverted burners, and has already made inverted lighting more popular than ever. It gives more light at less cost than any other type of inverted burner—**70** candle power for less than 3 feet of gas per hour.

PRICE: Burner only, 4s. Complete with Mantle and Globe, as shown, 4s. 10½d. Gem size or Bijou size, burner only, 3s.
The Welsbach Mantles for Upright Burners are "C," "CX," and "Plaissetty," 4½d. each. Inverted Mantles, 6d. each.

Welsbach-Kern Radiators for heating scientifically — and economically. —

RADIATOR O.J. Fitted with five tubes; suitable for a room 12 ft. square. Height 17 in., width 12 in. Finished in art black. Price 30s. Top to lift off with boiling ring attachment for kettle, 6s. extra.

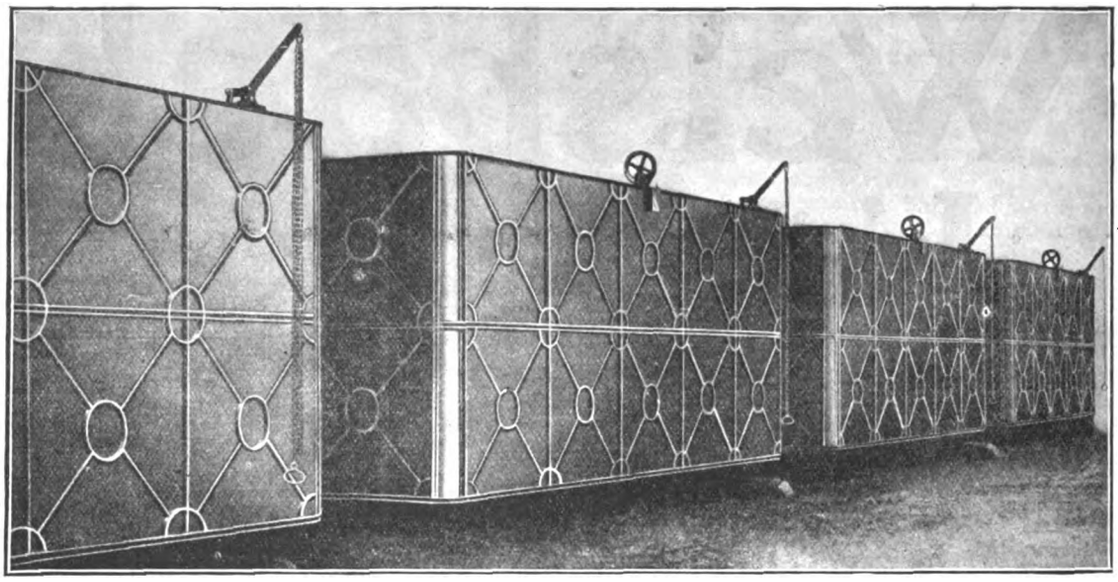
The Welsbach Radiators are gas fires with the important difference of being just as cheerful and just as healthy as coal fires, without the dust and without the work. They mark a distinct advance in gas heating, and heat a room more efficiently and at a lower cost than in any other way. They are inexpensive, and last a life-time. Made in 30 models to suit rooms up to 30 ft. square. See also Welsbach "Renown" Gas-heated Steam Radiators, for heating Churches, Institutions, Factories, &c.

The "LANCET" says:

"We doubt whether such an out-put of radiant heat has ever before been attained at so little cost and so low an expenditure of gas. The Welsbach-Kern Radiators give a cheerful, *healthy*, radiant heat, and are remarkably economical."

There is no waiting to burn up. The heat is there quickly, just when wanted.

Facts and figures about any kind of lighting, and Catalogues and descriptive booklets of Welsbach Light and Heat for all — purposes, will be forwarded post free on application to —



RADIATOR No. O.D. Fitted with five tubes. Suitable for a room about 12 ft. square. Height 16 in., width 14½ in. Finished in art black. Price 30s.

WARING'S

(WARING & GILLOW, LTD.)

Beg to intimate that they are prepared under the personal direction of Architects, to

BUILD, ALTER OR ENLARGE

Hotels, Public Buildings, & Town & Country Houses of any size.

The feature of their Constructional Work is Soundness and Stability, combined with Rapidity of Execution.

In Waring's vast New Building, recently opened, there are Departments for everything in connection with either Contract or Private Work, and Architects may be assured that their wishes will be faithfully and carefully carried out by efficient workmen under expert supervision.

Waring's manufacturing resources enable them to satisfy Architects' requirements at the lowest tender prices.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITION OPEN.

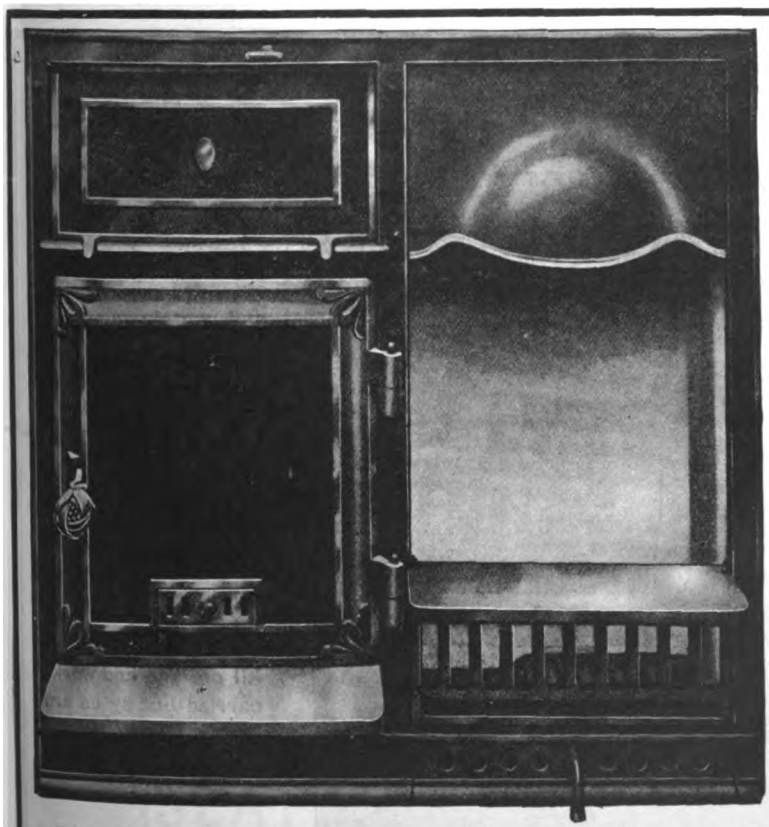
TRADE NOTES.

MACKAY'S patent direct-acting ventilators, supplied by Messrs. Cousland & Mackay, the sole makers, have been used for the ventilation of the central senior school, Gourock, now being erected from the plans of Mr. Alex. Cullen, F.R.I.B.A., I.A., of Hamilton and Motherwell, N.B.

UNDER the direction of Mr. J. E. Swindlehurst, M.I.C.E., Coventry, the "Boyle" system of natural ventilation, embracing the latest patent air-pump ventilators, has been applied to Spons Street schools, Coventry.



THE new Council schools, Hadfield, are being supplied with Shorland's warm-air ventilating patent Manchester grates, by Messrs. E. H. Shorland & Brother, of Manchester.

To meet the demands of their increasing business, the New Eccles Rubber Company are again extending their premises in Monton Road, Eccles, their architect being Mr. W. Canning, of Manchester. The reinforced concrete floors, with granitic finish, are being carried out by Messrs. Homan & Rodgers, Manchester.

THE two new children's wards at the Portsmouth Royal Hospital are to be brightened by the introduction of mural tiles pictures, under the superintendence of Mr. C. W. Ball, hon. architect. Wall spaces are provided for twenty-four, and of this number nine have been promised, at a cost of 25*l.* each, one of these being the gift of Messrs. Doulton & Co., Ltd., who are making this series of panels.

FOR the last few months alterations and improvements have been in progress at Dublin Castle, under the superintendence of the Board of Works. St. Patrick's Hall has been fitted with radiators for heating purposes, and hot-water pipes have been introduced into the other State apartments, which will henceforth be kept at an equable temperature. The supply is derived from two capacious Tangyes boilers, supplied by the firm of Messrs. Maguire & Gatchell, who carried out the heating and plumbing contract. An extensive addition has been made to the electric light installation.

MESSRS. T. T. GETHING & Co., quarry owners and quarry agents, Warwick Road, Kensington, W., have made arrangements with Messrs. Lamigeon & Co., Ltd., for the

"SIGNET"
(No. 2)
Combined Range & Register

Very suitable for Small Houses, Country Cottages, Flats, &c., where the same apartment is used as Kitchen and Sitting Room.

Combines in itself in a **practical** and **efficient** manner the essential features of a Cooking Range and a Sitting Room Grate.

Fitted with Patent Adjustable Damper, giving effectual control of chimney draught and economy of fuel—**an important feature.**

GOES INTO AN ORDINARY SITTING ROOM FIREPLACE.

Supplied in a variety of forms.

Large numbers in use throughout England and Wales, in Garden Cities and elsewhere, and giving universal satisfaction. Numerous unsolicited and enthusiastic testimonials received, copies of which, with full details of the grate, will be forwarded on application.

The Grate itself can only be supplied through Builders' Merchants, Ironmongers, &c.

working of the business in this country of the famous Caen stone quarries. These quarries were originally worked by James et Cie. They are at present worked by Mr. J. B. Fouquet. The quarries are being extensively developed, and blocks of any size and any length can be obtained. Messrs. T. T. Gething & Co. hold a very large stock at Caen ready for shipment to any port, whilst they will also be keeping a large stock at their London depôt, Shepherd's Bush. The firm are ready to compete in London and at all seaports with any freestone in the market.

MESSRS. JOHN PICKLES & SON, Hebden Bridge, Yorkshire, have just completed a full equipment for a large new sawmill and joinery works in Northern India, consisting of log-frames, rack sawbenches, &c., large four-cutter planing and moulding machines, besides joinery machinery of latest types for sawing, planing, trimming, &c., with necessary grinding and sharpening tools, besides electric log-hauling tackle. This machinery is electrically driven by alternating-current electric motors. Some of the machines are direct driven with separate motors; this, besides avoiding large quantities of shafting and belting, allows of their disposition in the sawmill to ensure the greatest advantage in consecutive operation with least handling of material. This complete plant will be on view in the makers' works at Hebden Bridge for a short time. We may add that Messrs. John Pickles & Son make a specialty of designing and equipping such sawmill plants throughout, and have been responsible for the largest mills and factories in many countries.

THE Carron Company, ironfounders, coalmasters, ship owners, &c., of Carron, Stirlingshire, has now reached the 150th anniversary of its foundation. Since 1759 it has enjoyed an unbroken and continued business career. Practically the pioneers of the iron industry in Scotland, the Carron Company has well earned and deservedly holds a world-wide reputation for the excellence of its manufactures of every description of cast-iron goods, such as ranges, grates, stoves, cooking apparatus, baths and lavatories, railings, stable fittings, gas appliances, &c., suitable alike for the mansion or cottage homes of this country or the camps and bungalows of other climes. Many awards have been made to the Carron Company during the past sixty years, and at the Franco-British Exhibition in 1908 a grand prix was awarded the company for excellence in design and workmanship—a proof (if proof were needed) that after a century and a half of existence the manufactures of this old corporation still maintain their high level of excellence.

BUILDING AND BUILDERS.

A NEW theatre of varieties is to be erected at Belfast by a Scottish syndicate.

THE school management committee of the Edinburgh school are considering a proposal to erect three schools to accommodate supplementary classes.

MR. FRANK N. COWLIN has been re-elected president of the Bristol Master Builders' Association, with Mr. F. Chown as vice-president. The annual banquet will be held in March.

MR. W. H. PRESCOTT, M.Inst.C.E., M.Inst.M.E., barrister-at-law and chief engineer at Tottenham, has succeeded Professor Henry Adams as president of the Institute of Sanitary Engineers.

AT a sitting of Glasgow Dean of Guild Court Archbishop Maguire was granted a lining for the erection of a Roman Catholic church in Old Dalmarnock Road and Savoy Street, Bridgeton. The estimated cost of the church is 10,800*l.*

THE Teesside Federation of Master House Painters held their annual meeting at Middlesborough last week. This year prizes to the value of 25*l.* were given to apprentices in eleven competitions.

MESSRS. MILTON, BODE & Co. have acquired a large site in City Road, Chester, at present covered by the coach-building premises of Mr. George Barnes, upon which to erect a music-hall. Messrs. Lockwood & Sons, architects, Chester, have been instructed to prepare plans.

MESSRS. T. C. MANN & SONS are pushing forward with preparations for the rebuilding of their factory at Cogenhoe, destroyed by fire on the night of January 6. The drawing up of the plans for the new building has been entrusted to Messrs. Brown & Mayor, of Northampton.

EIGHTEEN of the county boroughs of Lancashire have replied to the invitation of the county education committee to co-operate in the scheme to build a training college for

150 women teachers and to send delegates to a conference to discuss the matter. The college is estimated to cost 42,000*l.*, and the Exchequer will find three-quarters of the money.

THE subscribers to the Royal Hospital for Sick Children, Glasgow, last Friday approved of a scheme for the erection of a new hospital on a site of 10 acres purchased at Yorkhill. An appeal has been made for 100,000*l.* It is proposed to commence with buildings for 200 cots. Mr. J. J. Burnet is architect and Mr. A. B. Watson measurer.

MESSRS. NEIL M'LEOD & SONS, Edinburgh, have received the contract for work in connection with Troon waterworks. The work embraces the raising of the level of Loch Braden and a conduit from Loch Braden to Grimmet. The work, which will provide employment for a large number of men, will be started at once.

THE annual meeting of the Master Masons' Association of Glasgow and neighbourhood was held in the secretary's chambers, 175 St. Vincent Street, Glasgow, Mr. George Barlas, the president, in the chair. The meeting elected the following office-bearers for the current year:—President, Councillor William M'Neill; vice-president, Mr. Malcolm Stewart; treasurer, Mr. Robert Gilchrist.

THE Brynmawr District Council have decided to apply to the Local Government Board for sanction to borrow 3,000*l.* for the purpose of extending the western sewerage scheme. Mr. Baldwin Latham estimated the cost of making the connection at 7,500*l.* The Duke of Beaufort will contribute 5,000*l.* towards that sum, leaving 2,500*l.* to be found by the Council, who will apply for 500*l.* extra for contingencies.

THE plans of the new schools to be erected at Whitehaven have been modified by Mr. G. D. Oliver, architect. The total estimate now for the mixed school, to provide for 512 scholars, is 5,070*l.*, instead of 5,385*l.* The estimate of the infant school remains at 2,069*l.* The total original estimate of the schools has been reduced from 9,315*l.* to 9,180*l.* The education committee have resolved that the plans and estimate be sent to the Town Council.

IT is expected soon to begin the building of the new church of St. John Baptist, in Byfleet, Surrey. When completed the church will hold over 600 people. It is proposed to build the nave and transepts first at a cost of about 6,000*l.*, and the chancel and spire in the future at a cost of another 4,000*l.* The materials are to be flint with dressed freestone externally; red-tiled roof and oak-shingled spire; inside walls and dressing of freestone.

IN compliance with the requirements of Parliament estimates have been deposited by the North-Eastern Railway Company showing the expenditure which will have to be incurred in the event of sanction being given to all the new lines and new works sought to be constructed under their Bill for next Session. The total is put down at 400,417*l.*, of which 35,020*l.* will be spent on new lines in Northumberland; 212,000*l.* on a railway and staiths at West Dunston, Durham; 52,263*l.* on new lines in Hull; 13,407*l.* on a widening of the Hull and Doncaster Railway; 82,789*l.* on a jetty at Salt End, Hull; and the balance of 4,938*l.* upon five new roads. To meet this expenditure it is proposed to take power to raise 450,000*l.* additional preference capital.

THE Incorporated Institute of British Decorators held their annual meeting in the Royal Hotel, Edinburgh, on Saturday. The annual report showed that the membership of the Scottish branch was sixty-three, the same as last year. Two new Fellows and one Associate had been enrolled, and two Fellows had resigned and one had died. The committee approved of the establishment of a capital fund of 150*l.* by the central executive, and remitted 27*l.* 10*s.* as the first contribution of the branch. The committee also decided to send 15*l.* in the years 1909 and 1910, in each of which years it is proposed to add 100*l.* to the capital fund. The accounts showed a credit balance of 34*l.* Office-bearers were reappointed as follows:—President, Colonel Bennett, Glasgow; vice-president, Mr. James Clark; secretary and treasurer, Mr. George J. Cameron, Glasgow.

THE annual general meeting and conference in connection with the Association of Master Painters in Scotland was held in the Royal Hotel, Edinburgh, on January 21. Between seventy and eighty members were present, and the chair was occupied by Mr. William Mackay, Dundee. The annual report of the general committee stated that there were 207 members, which figure was almost the same as last year. Seven local associations are affiliated with the National Association, viz.:—Aberdeen, Ayr, Dundee, Edinburgh, Glasgow, Girvan, and Hamilton. In addition to the

SAVE 50% OF YOUR COAL BILL
BY USING THE PATENT
"Sine Qua Non"
KITCHEN RANGE.
Recent Testimonial.
DEAR SIRS,—The "Sine Qua Non" Range you made for us is a great success. It cooks perfectly and we get any quantity of hot water for bath, lavatory and sink, and the consumption of coal is less than half compared with the old Range.
The use of the slow combustion arrangement not only effects this saving but is a great comfort to the cook in protecting her from the heat of the fire, and in keeping the kitchen cool.
Yours faithfully, (Signed) J. T. GREEN.

members of the affiliated local associations there are thirty individual members. So far as the Association was concerned, there had been no serious conflicts between masters and men. Although there was a balance at the credit of the general funds of the Association of 34*l*. 16*s*. 8*d*., the debit balance in connection with the apprentices' competition and travelling scholarship fund now amounts to 113*l*. 13*s*. 8*d*. Mr. George Carfrae, Edinburgh, was elected president.

VARIETIES.

THE municipal gasworks at Dunbar are to be extended at a cost of 2,500*l*.

PART of the roof of Chesterfield parish church has been declared unsafe, and is to be immediately repaired. The galleries around the church were closed to the public on Sunday.

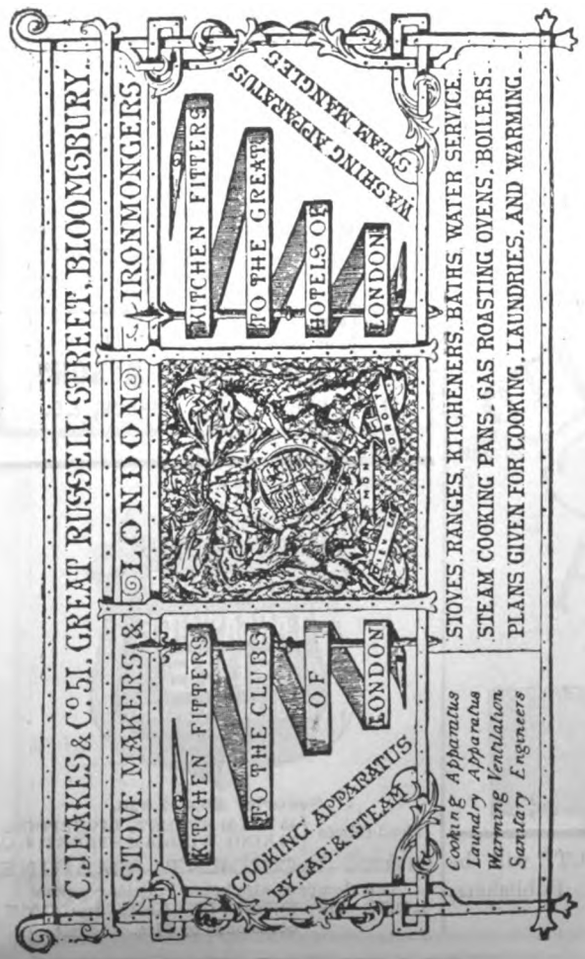
THE works and improvements committee, Inverness, have been instructed to consider as to the advisability of erecting entirely new burgh police buildings on some other site than the present buildings.

THE Great Central Railway Company have deposited estimates showing that the works mentioned in their Bill for next session will cost 99,868*l*. The money will be provided out of the 750,000*l*. additional 3¾ per cent. second debenture stock which it is proposed to raise.

THE library committee of the Bolton Town Council have resolved that plans be invited for buildings at Astley Bridge, Halliwell, and Great Lever from architects of the borough who have been in practice as principals for the past six months. Certain conditions to be noted by the architects were submitted by the chief librarian.

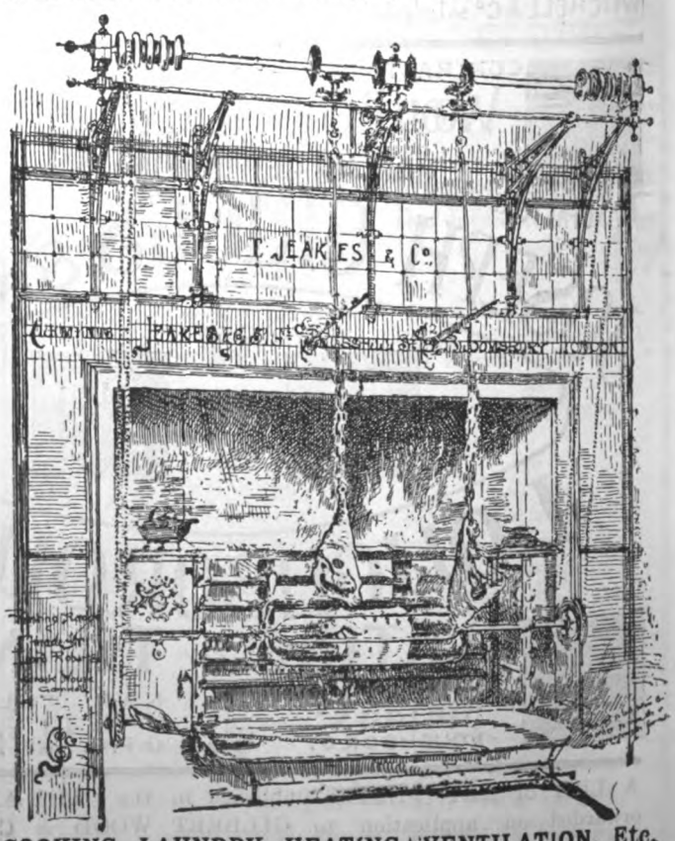
THE Glasgow Corporation are organising a conference on the proposal to have electric energy carried along the various railway tracks in Scotland by the North British Electrical Power Syndicate, Ltd. If such power were granted, wayleave would not be required from landed proprietors and County Councils.

AT the Criccieth Town Council meeting last week the chairman of the finance committee stated that the cost of obtaining the Act of Parliament in connection with the water scheme was 2,276*l*. The clerk said the costs of the Act were much more than anticipated. They had to visit London three times instead of once as expected, and they had exceeded their estimates by 417*l*.



THE Metropolitan Water Board at their last meeting opposed a supplemental estimate of 37,850*l*. in respect of the construction of the covered reservoirs at Honor Oak, S.E., the cost of which was estimated originally at 160,000*l*. The bulk of the extra cost is due to the necessity of strengthening the works in view of the shaly character of the clay, but 6,000*l*. has been spent in increasing the reservoirs' capacity.

THE annual distribution of prizes at the South Norwood technical trade schools, which were founded by Mr. W. F. Stanley, J.P., took place on Saturday. Mr. Stanley, who occupied the chair, announced that the premises had been taken over by the Charity Commissioners, and that he had endowed them with freehold property of the value of 25,000*l*. He felt sure that if British manufacturers wished to hold their own they must wake up to the practical necessity of giving opportunities to lads to become proficient in their trades.



A POLL of the Folkestone ratepayers has proved by a large majority hostile to the scheme for the promotion of a Bill by the Corporation by which a concert-hall would be erected out of the borough funds and managed either by the Corporation or by a syndicate or individual, and to guarantee such persons against loss in the enterprise. The Bill had been approved by the Council and also by a common hall meeting.

AMONG the petitions presented to Edinburgh Dean of Guild Court last week was one for the erection of a riding school at the Dean Bridge. Dean of Guild Wilson said it was proposed to build the school of corrugated iron. The site was one of the best in the city, and the Court could not approve of the proposal. The building must be of stone or compressed brick, harled. The petitioners agreed to consider the matter. Two warrants were granted and two remits were made to the burgh engineer.

THE Dublin Corporation on Monday agreed to sanction an application to the Local Government Board for a loan of 17,400*l*. for the extension of the artisans' dwellings scheme at Inchicore. It is proposed to erect 110 cottages on their

C. JEAKES & Co., ENGINEERS, 51, Gt. Russell St., LONDON

COOKING, LAUNDRY, HEATING, VENTILATION, Etc.

Digitized by Google

own ground, the income being estimated at 858*l*. An application is also to be made for 10,000*l*., being the cost of repairing and widening Annesley Bridge.

MONTROSE Town Council are finding great difficulty in securing a site for a reservoir and filter bed for their proposed water augmentation scheme. Mr. Bennett, C.E., Edinburgh, at first suggested a certain site on Sunnyside Asylum grounds, but on the score of danger to patients the management placed objections in the way. Mr .Bennett now suggests another piece of ground on the asylum land. It is, however, farther removed from the buildings than the other site, and it is believed an amicable arrangement will be arrived at. The scheme is estimated to cost 12,000*l*.

THE Warwick County Council have adopted the following resolution:—"That on the Midland Railway Company at their expense removing the old bridge and providing the necessary abutments satisfactorily to the county bridgemaster, and on not less than 500*l*. being provided by the landowners, the Meriden Rural Council or others, the Council rebuild Lea Marston Bridge as a one-span steel-girder bridge, 25 feet in width, with a clear waterway of 60 feet, at an estimated cost of 1,000*l*."

THE Central London Railway have deposited a Bill in Parliament to empower the company to extend their line from the Bank station to and under the Liverpool Street station of the Great Eastern Company, with a connection to the adjacent Broad Street station of the North London Company. It also provides for exchange subways to be constructed at the British Museum station of the Central London Company, and between the public subway at their Bank station and the booking-hall of the City and South London Company in Lombard Street. The Bill further provides for the raising of 330,000*l*. additional share capital, with borrowing powers of 110,000*l*.

A RESERVED decision on an important point under the Workmen's Compensation Act was given by Judge Shortt, at the Dover County Court, recently, in an action against Messrs. Pearson & Son, contractors, by the widow of John Tomlin, a fitter employed on the firm's Malta harbour contract. Tomlin had been employed by Messrs. Pearson on the Dover Naval Harbour works, and proceeded thence to Malta, where he was accidentally killed. Judge Shortt, in giving judgment for the widow, held that although the accident happened out of England the man was an Englishman and his contract was with an English company. Therefore it was only reasonable to conclude that the contract was made by all parties under the existing English law.

MESSRS. DENMAN & Co. have been awarded 38,500*l*. as compensation for the acquisition by the Westminster City Council of the front portion of No. 19 and 20 Piccadilly, with a view to setting back the line of frontage flush with the Piccadilly Hotel. After the street has been widened by the demolition of a part of the premises, a new front will be built, and they will be retained by the claimants. The frontage to Piccadilly of the part taken is 26 feet 10 inches, and the return frontage to Air Street about 28 feet, an area of 1,230 square feet; there will be left in the claimants' possession an area of 1,352 square feet. The building element in the case has been the subject of private proceedings before Mr. H. T. Steward (past-president of the Surveyors' Institution), and the amount of his award will be added to the verdict of the jury, whose inquiry was practically limited to the question of the leasehold and trade interests affected by the improvement.

THE annual report of the Bermondsey Borough Council discusses an experiment conducted at the baths by means of a special aeration and filtration plant. The system is to wash the water and put it back again in the bath, thus saving the considerable cost of refilling with fresh water. Though not good "as a drinking water," one analyst declared the washed water to be preferable to ordinary bath water. Yet the sample examined was from a bath in which 2,657 people had bathed. Dr. Eyre, of Guy's Hospital declared the filtered water to resemble the water from a newly-filled bath, although it had been in the bath ten months. Dr. Brown, the medical officer of health, says that in his opinion the chemical analysis shows a great improvement over that of the water before the filtering apparatus was started, and he considers the system to have come up to all expectations. Last year the cost of the water for the baths was only 5*l*. 17*s*., whereas before it was 243*l*. The new system shows a saving for the year of 174*l*. 18*s*. 4*d*.

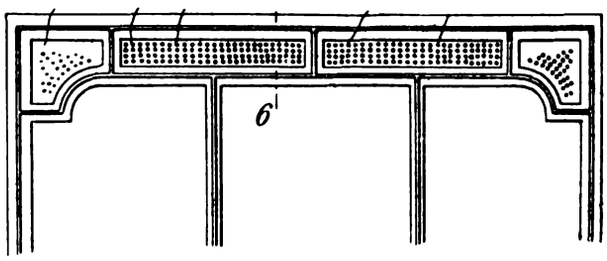
THE Buxton Council have decided on the erection of a verandah in front of the hot baths, upon plans to be laid before the Duke of Devonshire's estate agent, and to be further considered by the Council. The probable cost will be about 800*l.*

THE Liverpool City Council have under consideration two alternative schemes for new municipal abattoirs—one the rebuilding of the present abattoirs, built by the Liverpool Abattoir Company about seventy years ago, on the present site in Trowbridge Street, and the other the erection of an entirely new establishment on vacant land in Love Lane, behind Stanley Dock. A deputation has been appointed to visit various abattoirs erected in the United Kingdom and on the Continent.



THE Hull Corporation water and gas committee have agreed to an arrangement with the Digit Disinfectant and Soap Company, Ltd., of Huddersfield, for the renting of three acres of land at Stoneferry for a soap and disinfectant works at Hull. The site has a river frontage of 120 feet. The company propose at once to lay down 5,000*l.* in plant, and in two years to lay down 10,000*l.* Building in connection with a laboratory, offices, and houses for workpeople will, it is expected, be proceeded with at once.

THE Farnham Rural District Council have resolved:—"That the attention of the Local Government Board be drawn to the insufficient powers possessed by the Rural District Councils to secure a sufficient amount of open land around new houses, and, further, that owing to the erection of houses on spaces of inadequate areas the Council has met with serious difficulties and expenses in connection with drainage schemes, and are apprehensive of further difficulties unless additional powers are granted."

THE Land Club Union suggest that Lord Carrington should instruct the Board of Agriculture "to obtain priced designs for bungalow cottages of a removable character, which could be put on small holdings, with or without the aid of the County Council." It is estimated that an annual charge of 7*l.* 4*s.* on a cottage costing 120*l.* would suffice to protect the State against loss, and that at the expiration of twenty-five years the cottages would be the property of the Council, available still in many cases for habitation or for conversion into farm buildings.

A NEW VENTILATOR.

THE patent here illustrated has not yet been placed on the market, but will be ready for sale in a week or two. It consists of panels made of glass, iron, copper, porcelain or other material, provided with a series of nipples in the form of truncated cones, each of which has a hole at the apex. Suppose one panel is placed over a shop window, as in our illustration. If it is desired to extract the foul air from inside the window, the nipples are placed on the outside, then the wind striking these cones cannot pass through, but instead extracts the air from within. If fresh air is to be admitted, the ventilating panel is reversed and the nippled surface is to the inside. A simple demonstration of the difference in the action of the two faces is afforded by

placing a lighted candle behind a panel and blowing on the other side; if the nipples are towards the blower, the flame is scarcely affected, but if the nipples are on the inside, the candle is blown out at once. This extremely simple invention promises to be particularly valuable in shops (where it would prevent window steaming) and in railway carriages. It is suggested that for the latter one or more ventilators should be used for the egress of the foul air, and a corresponding number for the ingress of pure air. The uses to which "Minnitt's New or Improved Ventilator for Windows or other Places" can be put are obviously many. The invention is the work of a warming and ventilating engineer, who knows the requirements which he has to meet. The London office of Mr. H. T. Minnitt is at 6 Cecil Court, Charing Cross, W.C.

FORESTRY IN THE UNITED STATES.

THE United States Department of Agriculture have issued a report as to Forest Preservation. It is made evident that in the last ten years, forestry has advanced in the States from an almost unknown science to a useful growing profession. In that time the number of technically trained foresters has increased from less than a dozen to over 400. Ten years ago there was not a single forest school in the country, now there are several professional forest schools which rank with those of Europe, and a score more with courses in elementary forestry whose usefulness is steadily growing. Forest lands under management have grown from one or two tracts to many, aggregating 7,503,000 acres, scattered through thirty-nine States. The National Forests have increased from 39,000,000 acres, practically unused and unprotected, to 165,000,000 acres, used, guarded and improved both in productiveness and accessibility. The number of States which have State forests has increased from one to ten, and of those which employ trained foresters from none to eleven. The membership of forest associations has increased from 3,600 to 15,800. Ten years ago, except for a few of the foremost botanists, European foresters knew more about American forests than did the people of this country. In Europe they were then using preservatives to prolong the service of beech ties, and so adding from twenty to forty years to their life. Here, on the other hand, scarcely a treated tie had been laid, though there are now sixty treating plants, twenty-seven of which treat ties exclusively, and an engineer who recently returned from Europe reports that both in size and mechanical perfection the treating equipment of this country is ahead of any to be found abroad.

And yet American forestry has only safely passed the experimental stage and got ready to do something. Action, immediate and vigorous, must be taken if the inevitable famine of wood supplies is to be lessened. We are now using as much wood in a single year as grows in three, with only twenty years' supply of virgin growth in sight. Only the application of forest knowledge with wisdom, method and energy, in the next ten years, can prevent the starving accumulation of interest.

The application of intensive forestry to large tracts tice of forestry. It is accessible enough to allow of moderate cuttings at frequent intervals, and it may be protected from trespass and grazing and from fire, its chief enemy, without an elaborate scheme of defence; then taxation is not a great burden, because the revenue from farm supplies more than meets this item every year, and thus prevents the accumulation of interest.

The application of intensive forestry to large tracts will naturally be of limited extent for some time to come. Closer utilisation, the setting of a minimum diameter below which trees shall not be cut, to provide for a second crop, and protection from fire, are conservative measures which are steadily gaining ground. But looking into the future far enough to make provision for a third crop is not yet common, while efforts to bring forest lands to high productive capacity have as yet scarcely been attempted. In wealth of soil and high commercial value of native trees America has a decided advantage over Europe, where intensive forestry is paying well. American corporations and longtime investors, as well as the provident farmer, must go deeper into forestry to reap full reward.

The increase in the number and size of railroad treating plants during the year has been phenomenal. The scarcity of suitable timbers for railroad timbers for railroad ties, combined with the high prices which they consequently command is one of the reasons for the remarkable increase in the number of railroads which are beginning to treat and use the inferior timbers found along their own lines.

In 1902 the number of railroad treating plants was seven; last year it was twenty-seven, being an increase of twelve over the number for 1906.

Reports of the American Railway Engineering and Maintenance of Way Association show that the railroads which have been pioneers in treating timber have found it a paying investment. The Chicago and North-Western Railway erected a tie plant in 1903, and since then has been treating hemlock and tamarack at the rate of about 600,000 ties a year, and now treats also beech, birch and maple. The Santa Fe Railway has laid thirteen and a half million treated ties, and the records show the average life of those first laid to have been 10.62 years. When, in 1904, a considerable amount of main line track in New Mexico was washed out and replaced temporarily with untreated ties, treated ties were substituted as soon as they could be

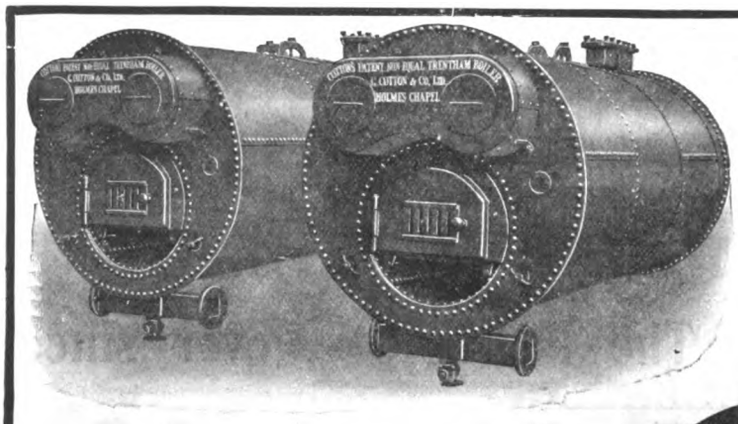
obtained, and the untreated ties were sent to the plant for treatment. According to the latest reports, a total of 12,000,000 ties annually, or 12 per cent. of the total cut, are now treated.

Delaware, Kentucky, Missouri and Mississippi are better acquainted with their forest resources by reason of forest surveys conducted in co-operation with the Forest Service. Taxation, now the most difficult problem in State forest work, is receiving thoughtful attention.

A very successful plan in Ohio of co-operating with landowners in establishing plantations and maintaining their timber tracts in such condition that they will serve as educational examples in correct forest practice has been extended until practically every county in the State has been covered. This includes the preparation of plans for managing woodlots and timber tracts and the furnishing of planting material which will be grown according to plans and instructions furnished. A total of 466 farmers are thus co-operating with the State experiment station. A State forest survey has been begun.



Among the varied activities of the Indiana forestry commission, none is more productive of better results than the encouragement of planting, by experiments conducted on the State reserve and by published information on forestry in general and on the success of those who are growing timber in Indiana.

In Michigan, during the fiscal year 1906-7, dead timber to the value of over $3,000 was sold from the State forest reserve. Over sixty miles of fire lines have been built. Owing to the efficiency of the fire patrol, no fires occurred last year. The plantations of the Saginaw forest farm, at Ann Arbor, are becoming a valuable object lesson, not only for school and experimental purposes, but for the general public. The Cleveland Cliffs Iron Company have increased their staff of foresters and are planning reforestation on a large scale. On the Ausable river, on Manitou island, and at Cedar Lake, landowners are carrying on extensive reforestation. Two investors at Grayling are purchasing lands and making preparations to convert these into regularly managed forest properties. The forestry commission distributed over 60,000 seedlings for experimental plantations among various landowners in the State. Forest sentiment among the people, among legislators, and with the press is steadily growing. One of the best illustrations was the enthusiastic meeting of the Northern Michigan Press Association at Traverse City, where an entire evening was devoted to forestry, and reforestation was strongly advocated.

During 1907 the most important forest work in Wisconsin was the appraising and selling of scattered and agricultural lands and the use of the proceeds to purchase other lands suitable only for forestry, so as to consolidate the main forest reserves on the headwaters of the Wisconsin and Chippewa rivers. About 15,000 acres have recently been purchased. Concessions have been granted private capitalists to store water at the headwaters of streams, the promoters to reap benefit from the sale of water power. Much interest centres in this attempt of private capital to establish reservoirs which will operate in conjunction with the forest cover in the regulation of streams.

The forest law of Minnesota of 1895 made town supervisors fire wardens under direction of a chief warden, who, among other duties, was required to make an annual report, including "important facts relating to forest interests." The annual appropriation to execute the law is $11,000. The legislature of 1907 placed Itasca State Park, at the headwaters of the Mississippi, under charge of the forestry board, appropriated $2,000 a year for demonstration work there and $1,500 for fire breaks, development, and improvements. It also appropriated $2,500 for planting on the Pillsbury Reserve the three year old Norway spruce seedlings the board had raised on that reserve. An area of 185 acres was thus planted at an expense of $6.50 per acre. In 1906 the board imported 20,000 white pine seedlings from Germany, which were planted the same spring on the Pillsbury Reserve.

THE Chester Town Council have granted the Chester Race Company a ten years' extension of the lease of the Roodee, until the year 1929. The extension was granted on the condition that the company spend 10,000*l.* on improvements, including the reconstruction of the Dee stands, the Council stipulating that the public view over the Roodee from the city walls be not encroached upon.

ARCHITECTURE, FURNISHING, DECORATION, FINE ARTS.

E. LYON-CLAESEN, Publisher, 8 Rue Berckmans, Brussels.

The house makes a specialty of publishing artistic editions of all kinds—*editions de luxe*—and can supply all the works treating the subjects of Architecture, the Industrial and Decorative Arts, Furniture, Painting, Sculpture, the Fine Arts, &c.

TOURS ET TOURELLES HISTORIQUES DE LA BELGIQUE, or THE HISTORIC TOWERS AND TURRETS OF BELGIUM. From the water-colours of JEAN BAES. Among the architectural publications on the ancient edifices of Belgium, scarcely any can be found which give a reproduction of the admirable towers and charming turrets, so justly considered of the greatest interest. This work consists of 50 coloured folio plates, difficult to distinguish from the originals, mounted on handsome cardboard and contained in a rich portfolio. Price £4.

TRAVAUX D'ARCHITECTURE EXÉCUTÉS EN BELGIQUE, or ARCHITECTURAL WORKS EXECUTED IN BELGIUM. By HENRY BEYEART, Architect. This work contains the most interesting productions of Henry Beyeart, and presents, with fullest details, his principal edifices. It is the reproduction of his own designs arranged by himself. Each construction is explained by plans, details, elevations, sections, &c., drawn to scale. The work consists of 240 folio plates, in two portfolios. Price complete, £14.

L'EMULATION.

A MONTHLY JOURNAL. ORGAN OF THE "SOCIÉTÉ CENTRALE D'ARCHITECTURE" OF BELGIUM.

The latest volume of the New Series is in preparation, and will form a valuable addition to the Collection. Each number consists of four or five folio plates, eight pages of text, and a Supplement of twelve pages. It produces in chromolithography, heliogravure, phototype, etching, &c., prominent examples of ancient and current architecture, and the text is devoted to this profession. The Supplement contains articles pertinent to architecture, and advertisements. Subscriptions date from January 1. Price per year, £1 8s. The whole year, when complete, in portfolio, £1 12s.

E. LYON-CLAESEN, ART PUBLISHER, BRUSSELS (BELGIUM).

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITION OPEN.

WALES.—Feb. 20.—Plans are invited for a new chapel at Penclawdd to contain 800 sittings. The approximate cost of chapel, including heating and acetylene lighting apparatuses to be 3,000*l.* A premium of 5*l.* 5*s.* will be awarded the architect whose plan the committee may select. Mr. John Rees, secretary, Penlan, Penclawdd, S.O.

THE Bexhill Town Council on Monday decided to advertise for tenders for the construction of a colonnade, and the erection of a bandstand and shelters on the new central parade, in order that there shall be no delay in getting to work after the Local Government Board inquiry.

THE work of raising Portland new breakwater has commenced. The proposal is to cut away a length of the inner portion of the breakwater, making it flat at the back, and placing the stone removed on to the top, thus raising it 11 feet. By this means the outer face will be sloped off, thus giving less resistance to the waves. Storehouses and other buildings are to be erected on the breakwater. The extension of the camber is being actively pushed on, and when finished it will be 300 feet in length, providing accommodation for landing at about half a dozen stages.

THE *Colonial Office Journal* gives a description of a scheme for a water supply to Accra, Gold Coast, which has been prepared by Messrs. Middleton, Hunter & Duff, MM.Inst.C.E., Westminster and Edinburgh. The dam will be formed of concrete, the trench for which will be sunk with the aid of steel piling on both sides, which, it is believed, from experience elsewhere, will have the effect of greatly reducing pumping during the sinking and filling up of so deep a trench as is required. The capacity of the reservoir is such that there will be sufficient water to provide power to drive turbines to pump the supply of water to filters and tanks at a high elevation, whence it will gravitate to Accra. The estimated cost of the works is 190,450*l.* The dam is so constructed that it can be raised at a small cost by 4 feet, which would give water for additional power to drive dynamos for electric lighting in Accra.

COAL BILL
BY USING THE PATENT
"Bond" Stove
Recent Testimonial.
DEAR SIRS,—We have much pleasure in testifying to the very high opinion we have formed of your "Bond" Fires. The great heating power that they give with a comparatively small amount of coals, together with the excellent workmanship of the copper and steel work, are getting us many repeat orders for these stoves.

The Widnes Town Council have agreed to make Mr. Parr, the gas and waterworks engineer, a gratuity of 250 guineas for special work done in connection with the laying down of a new water plant.

Scagliola Marble

An old Italian process, revived in the early part of the Sixteenth Century by Guido Sassi; is not a surface decoration, but a thoroughly artistic material. It was largely used by the Florentines in some of their most elaborate works, and was introduced into this country by Mr. J. Wyatt about 1750. It has been manufactured by this firm for the last 85 years, and fixed in many of the most important buildings in the Kingdom.

By Special Appointment

To His Majesty.

SPECIALITÉ for surrounding Iron or Brick Cores.

These being fixed in the ordinary course of construction the Scagliola can afterwards be fixed round **WITHOUT SHOWING JOINT.**

Prize Medals, 1851 & 1862.

A DECORATIVE MATERIAL of the RENAISSANCE WHICH HAS STOOD THE TEST OF CENTURIES.

COLUMNS, PILASTERS, WALL-LINING, DADOS, and all forms of INTERNAL DECORATION.

Descriptive Circular on Application.

THE subscribers to the Perth Infirmary at their annual meeting on Monday, instructed the directors to submit a scheme to erect a new infirmary on a new site. It is calculated a new building to accommodate 100 beds can be erected at a cost of 40,000*l*.

MESSRS. EASTON GIBB & SON, London, who have secured the contract for the new naval base at Rosyth, have stated that the work will be put in hand almost immediately. When a start has been made at least 1,000 men will be engaged, and later, five times that number. The principal proposals of the scheme include a large dock, a large entrance lock, a long river wharf, a floating dock, a basin for submarines, a boat slip, ammunition magazines, and workshops and storehouses. Seven years is the time allowed in the contract for the completion of the scheme. The estimated cost of the proposals is three and a quarter millions sterling.

BUILDING AND BUILDERS.

PLANS have been passed for an addition to the Biggart Memorial Home, Prestwick, at an estimated cost of 4,500*l*.

THE Manchester City Council give official notice of their intention to provide a new public elementary school for about 500 children at Monmouth Street, Rusholme.

MESSRS. BRYDEN & WALTON, architects, Buxton, have been instructed by the Bakewell Urban Council to proceed with specifications and quantities of the proposed baths and pump-room, which will cost about 3,000*l*.

THE designs submitted by Messrs. George Baines & Son, 5 Clement's Inn, Strand, London, W.C., in a recent competition for Palmer's Green Congregational Church have been adopted, and the erection of the buildings is to be at once proceeded with.

THE Local Government Board have signified their willingness to accept the original scheme of the Bradford Corporation for the sewage of Esholt. It includes an all-masonry viaduct across the Aire Valley, which is estimated to cost 75,000*l*.

THE directors of Aberdeen Royal Infirmary state that with the generous gift of 26,758*l*. received in May last from Lord Mount Stephen they propose to increase and improve the accommodation to enable the hospital to cope with the ever-increasing demands upon it.

MR. A. E. PRIDMORE, architect, who is engaged by the St. Pancras Board of Guardians to prepare the plans for the new operating theatre for the North Infirmary, has given the approximate cost of heating the theatre as follows:—Electricity, 75*l*. 2*s*.; gas, 175*l*. 15*s*.; steam, 147*l*. 5*s*.

AT a meeting of Coventry education committee last week recommendations to erect two new elementary schools were received, one in Mile Lane, the price not to exceed 16,000*l*., and the other in Broad Street, price 11,500*l*. The proposals were adopted, after an amendment to build shower-baths at the schools had been defeated.

MESSRS. H. LOVATT, LTD., builders, of Wolverhampton, have secured a contract from the Great Western Railway Company for the reconstruction of Snow Hill passenger station, Birmingham. The total will amount to nearly 100,000*l*. The work includes the demolition of the present station and the erection of a new building.

HAMILTON Burgh School Board, N.B., have decided to build a new academy, and have adopted the recommendation of a special committee of their members to erect the new building in Auchincampbell Road on four acres of ground. A small committee has been appointed to visit other recently erected schools for the purpose of aiding the Board in selecting a design.

AT the L.C.C. Central School of Arts and Crafts, Southampton Row, W.C. (Department of Architecture and Building Crafts), a course of five lectures on the materials of construction and decoration will be delivered by Mr. Noel Heaton, B.Sc., F.C.S., on consecutive Thursday evenings at 8.30 P.M., commencing February 18. This course is intended primarily for students of architecture, and will supplement the instruction given in building construction. The subject will be dealt with from the scientific standpoint, but no previous knowledge of science on the part of the students will be assumed. The main principles of chemistry, geology and physics will be reviewed and their bearings on architecture discussed as revealing the nature and properties of materials, providing a basis for judging their quality, and determining the extent and limitations of their use in building.

A NEW bath house, embracing both Turkish and Russian baths, with hydropathic treatments, has just been opened at 92 Jermyn Street, Piccadilly, W. The architect, Mr. E. H. Adams, of Chichester House, Chancery Lane, has succeeded in combining all that is best in both the baths, the air being sterilised by the high temperature to which it is brought by the heating and steam apparatus, while the constant change taking place ensures its freshness, and the new metallic filament electric lighting pervades throughout. The walls are lined with enamelled copper, and along the side of the Russian bath are tiers of marble slabs. The Turkish bath comprises three hot rooms, viz. the tepidarium, the calidarium, and the radiatus. The heating apparatus has been supplied by Messrs. Crumblehulme & Sons, Ltd., of Bolton, and the lift by Messrs. Waygoods, Ltd., while the douching apparatus, sanitary and other fittings have been supplied by Messrs. Doulton & Co.

TRADE NOTES.

NEW elementary schools for the Lancashire County Council are now being erected at Failsworth and also at Great Crosby, under Mr. Henry Littler, county architect. The constructional steelwork, concrete floors, and asphalte flat roofs are being carried out by Messrs. Homan & Rodgers, Manchester.

A NEW porch is now being added to Reigate parish church, under the supervision of Messrs. J. O. Scott & Sons, architects. Chilmark stone is being used and supplied by Messrs. T. T. Gething & Co., proprietors of the Chilmark Quarries, Wilts.

THE Catholic schools, Maesteg, are being warmed and ventilated by means of Shorland's patent Manchester grates and inlet ventilating panels, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

MESSRS. JAMES DUTHIE & Co., the sole agents for Duresco in Scotland, have issued a calendar with a view of a castle, thus suggesting the uses which Duresco can be put to, whether used in castle or cottage. Duresco has proved its value by the improved demand made for it year by year.

MESSRS. PATMAN & FOTHERINGHAM, LTD., builders and contractors, have nearly completed two important West End buildings, viz., 4-6 Glasshouse Street, W., facing Piccadilly Circus, under Mr. E. Keynes Purchase, and also the Albemarle Club, Dover Street, W., under Messrs. Smith & Brewer, architects.

THE Linolite Company inform us that, owing to the expansion of business, it has been found necessary to provide larger works for the manufacture of "Tubolite." The company has therefore purchased the freehold of three-quarters of an acre of land at South Acton, and the existing buildings have been rearranged and adapted to the firm's requirements so as to insure the comfort of the workmen and afford adequate provision for dealing with the output.

MESSRS. E. & F. N. SPON, LTD., are well advised in issuing their "Architects' and Builders' Price Book" of a size that will fit into an ordinary pocket, the actual dimensions being 6½ inches by 3¾ inches by ½ inch thick. Although the size has been thus considerably reduced, all the most useful features of the previous thirty-five editions have been retained and much new matter added. Sufficiently thin paper is used to enable nearly 600 pages to be inserted between the leather covers. The contents are thus arranged:—(1) Memoranda section, 355 pages; (2) price book section, 161 pages; (3) index to price book; (4) buyers' directory. The memoranda contain a great amount of valuable concentrated information arranged alphabetically, which the architect and builder would have to make a wide search for if he was without a Spons' Pocket Price Book. The editor is Mr. Clyde Young, A.R.I.B.A., and the book has been revised by Mr. Stanford M. Brooks, architect.

MESSRS. WM. POTTS & SONS, LTD., clockmakers, Leeds, have received instructions to put in hand a large turret clock, to strike the hours and half-hours and show the time upon four large illuminated dials, for abroad. They are at present also engaged in thoroughly overhauling Thirsk Memorial Tower clock at the Market Square, and have other important work in hand.

MR. LEON GASTER, A.M.I.E.E. (editor of *Illuminating Engineer*), will deliver a course of four Cantor lectures before the Society of Arts on "Modern Methods of Illuminating Engineering," beginning February 15. Lecture I. will deal with "Electric Lighting"; Lecture II., February 22, with "Gas Lighting"; Lecture III., March 1, "Lighting by Candles, Oil, Acetylene, Petrol, Air-gas, Alcohol and other Illuminants"; Lecture IV., March 8, "General Problems in Illumination and Illumination Measurements."

THE Aston education committee report that in recent years the Board of Education have pressed upon them the necessity of erecting outside staircases at certain girls' schools which were not upon the ground floor, and which had only one means of entrance and egress. As an experiment, an emergency staircase of the type suggested was erected at Burlington Street schools in 1904. The committee now recommend that the four other schools should be similarly provided, and have submitted plans to the Board of Education, at a cost of 850*l*.

VARIETIES.

THE public health committee of Edinburgh Town Council recommend that the salary for the office of sanitary inspector be fixed at 200*l.* and that the office be advertised.

SWANSEA housing committee has agreed that preference of Corporation houses be given to those dispossessed; further, that a site be procured to erect 200 additional houses.

THE Llandrindod Wells Urban Council have decided to apply to the Local Government Board for sanction to borrow 10,000*l.* for the erection of a pavilion in the recreation ground.

INVERARY Town Council have under consideration a scheme for thoroughly repairing the stone pier and extending and constructing breast walls on either side of the pier. The work will cost over 6,000*l.*

THE opening ceremony of the new buildings for Wellington Street Baptist Schools and Institute, Luton, took place on Wednesday last. The contract has been carried out by Messrs. T. & E. Neville, of 30 Castle Street, Luton, and amounted to 5,000*l.* The architects are Messrs. George Baines & Son, 5 Clement's Inn, W.C.

ABOUT 50 acres of what is known as Cammell Laird's "option" at Swansea Burrows has been secured by Baldwin's, Ltd., of Birmingham and South Wales. Plans have been prepared for the erection upon the site of blast-furnace plant and tinplate and steel works.

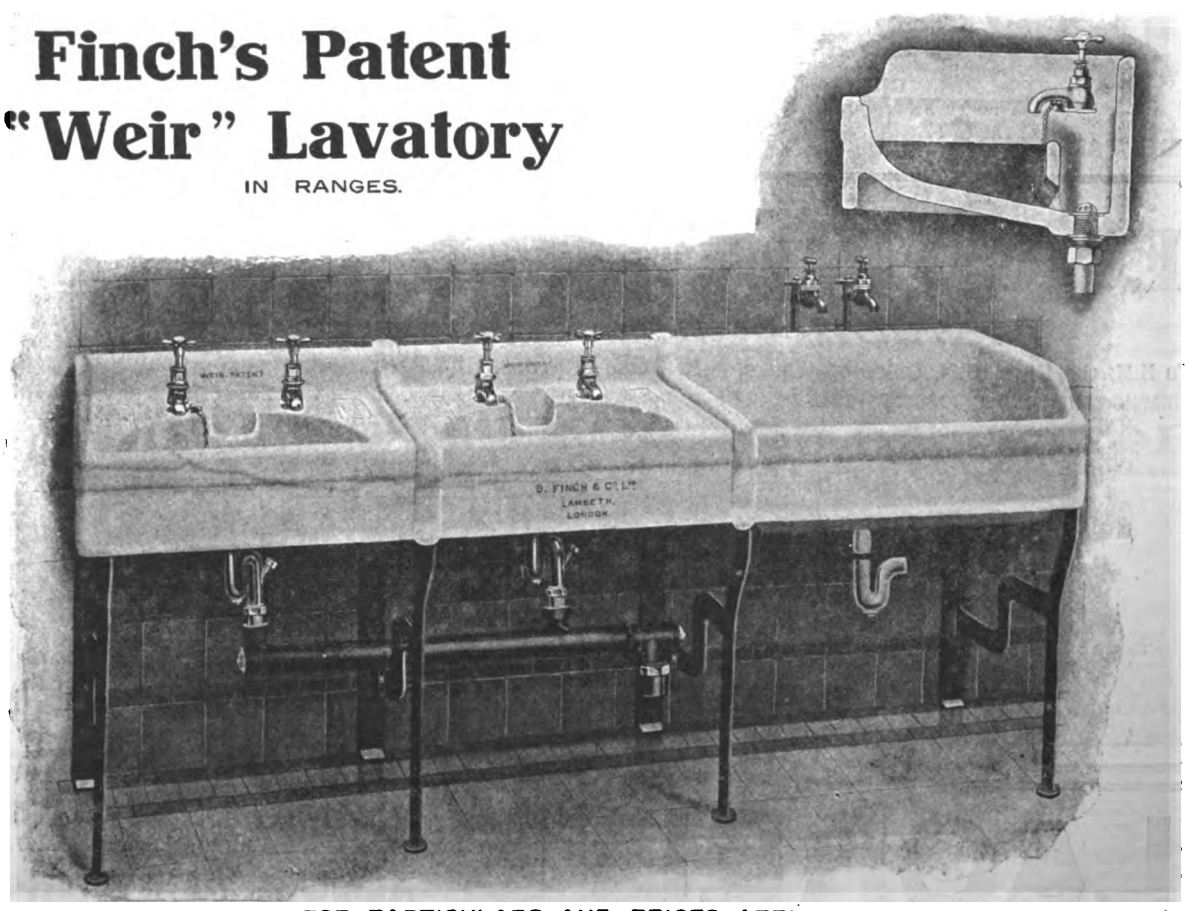
THE Urban District Council of Ventnor, Isle of Wight, have decided to give instructions for the preparation of plans, estimate and specifications for the construction of a funicular railway from the esplanade to the downs overlooking the town.

IT is proposed to erect 300 houses just outside Newport borough boundary on Malpas Road. The Newport sanitary committee recommend that the drains of the new houses be connected to the town main sewer at 5*d.* in the £ upon the rateable value of the properties connected.

THE Salford Town Council will shortly apply to the Local Government Board for sanction to borrow 30,788*l.* to cover the cost of carrying out the Pendleton relief sewer scheme and the construction of sewers in the district of Irlams-o'-th'-Height.

GREAT BRITAIN has been awarded a grand prix d'honneur for their exhibit at the International Congress on the Care of the Insane, held at Milan in 1906, for the plans of the asylums at Ayr, Hellingly (East Sussex) and the London County Council asylums.

THE Bath docks committee recommend the widening of Bath Bridge by cantilevers, thus increasing the width of the footpaths from 6 feet to 8 feet 4 inches and the road from 30 feet 6 inches to 33 feet 4 inches, the estimated cost of which has been agreed between the committees at 1,267*l.*



THE Gloucestershire education committee have adopted plans for the erection of a proposed Craft School at Stroud. They provide a school building with accommodation for 120 boys (three class-rooms for forty each), together with two teachers' rooms, and in addition a separate building to be used as workshops for woodwork, ironwork, blacksmithing, textile work and stonework.

THE Thames Conservancy have informed the London County Council as to the decision of the assessor as to the compensation payable by the Council to the Conservators for the lands taken and the proposed permanent works in the river in respect of the erection of the embankment wall for the new County Hall. The amount of the assessment is 15,330*l.*, and the assessor's fee, which is also payable by the Council, amounts to 157*l.* 10*s.*

THE Gamewell fire-alarm system is shortly to be set up in Manchester, at a cost of 13,870*l.* The main principle of the system in contradistinction to others is that the signalling circuit is always "closed," and an electric current is kept continuously circulating round it. The great advantage of this system over an "open" circuit system lies in the fact that the latter has to be closed and an electric current caused to flow before a signal can be transmitted.

THE Staveley Coal and Iron Company, *Ltd.*, have arranged to acquire a new coalfield in the Doncaster district. The works will shortly be erected on a site between Warmsworth and Edlington Wood. A plant is to be put down with all the latest appliances, and the estimated output is to be between 4,000 and 5,000 tons daily, and employment will be found for upwards of 2,000 workmen. In order to meet the requirements caused by the incursion of a new population in the district, a new village will be built.

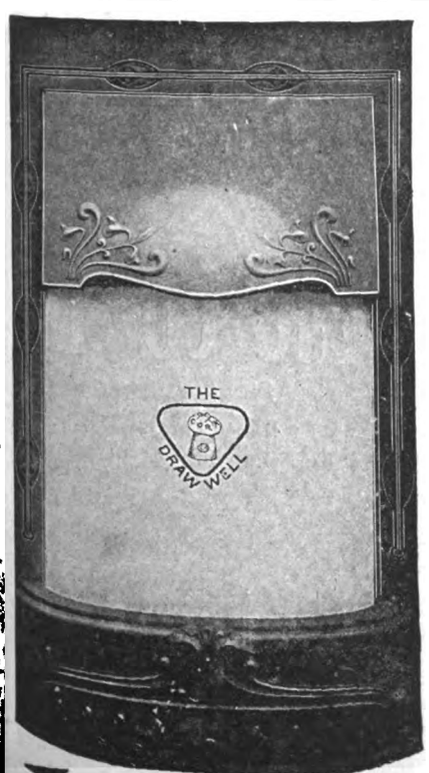
THE question of tramway rails was discussed at a special meeting recently of the Hull tramways committee, when it was decided to give the order, proposed to go to the Angleure Company at Liège, to Messrs. W. Scott & Co., at Leeds. The engineer reported that he had written to five English firms, asking whether they supplied similar rails to those required at Hull and Doncaster. One company had not replied, two had stated that they were unable to quote; Messrs. W. Scott & Co. quoted for 350 tons of rails. The committee decided to accept the tender of the Leeds firm for Sandberg rails, at 7*l.* 5*s.* per ton. The price represents an increase of 5*s.* per ton on the price of the Belgian firm, and as the Hull Corporation require only 125 tons, the difference amounts to 30*l.* The Doncaster Corporation will join the Hull Corporation, and will take the balance of the 350 tons of rails the Leeds company require to carry out the order.



THE Birmingham education committee have adopted the following recommendation of their sites and buildings committee:—"That that portion of minute No. 946 giving to the architect as part of his duties the preparation of quantities for work of alterations to school buildings, &c., not exceeding 5,000*l.* in value be rescinded, and that in future this work be entrusted to Mr. Rowse, quantity surveyor; also that certain arrangements be entered into with the quantity surveyor in reference to commission charges." The portion of the minute referred to reads as follows:—"That the preparation of quantities for work of alterations, &c., to school buildings, not exceeding 5,000*l.* in value, be prepared by the architect as part of his duties, at a commission of 1½ per cent."

THE United States Navy Department are about to carry out a comprehensive series of tests on concrete immersed in sea water at the Navy Yard, Charlestown, Mass. The object of these tests is to determine what the action of sea water is upon concrete, both as regards climatic conditions and chemical action. The tests are to be made as nearly as possible in conformity with usual commercial work, in order to be comparable in all respects with actual work. The specimens are to be built in accordance with the requirements of the Navy Department and under their direct supervision. They are to be built in moulds in the sea in such position as may be directed and exposed for easy inspection and for photographing. They will be so marked as to be easily identified, and a careful record of the materials used and methods will be kept for each specimen.

THE City Architect's Department in Toronto have issued a regulation prohibiting the admittance into places of amusement of more people than can be provided with seats. Some of the town halls and many of the places of popular amusement throughout the province, where large crowds assemble, seem specially constructed to invite a catastrophe. Inadequate exits, flimsy wood construction and dangerous methods of lighting and heating are common.

THE London County Council in 1907 agreed to lease to the Government of Victoria for ninety-nine years, at a rent of 874*l.* a year, a site at the junction of the Strand and the eastern spur street, now known as Melbourne Place, between the Strand and Aldwych. A design was received in July 1907 of the elevation of the buildings to be erected on the site, and, as this was unsatisfactory, further designs were submitted. Eventually Mr. R. Norman Shaw, R.A., offered to assist the Council, and prepared a sketch design which the improvements committee and the architect acting for the Government both approved. Having regard to the importance of the site and to the effect which the elevation of the buildings erected thereon would probably have on the design of the buildings to be erected with a frontage to the Strand on the remainder of the crescent site, it was considered very desirable that every effort should be made to secure an architectural treatment, satisfactory in all respects, of the proposed buildings. In the case of a building on an ordinary site, the original design might perhaps have been accepted. Plans based on Mr. Norman Shaw's sketch design were eventually approved in January 1908. The Government of Victoria have asked for a rebate from the rent payable in consequence of the delay which arose in the approval of their plans and their inability to occupy the new buildings by the date anticipated. The period occupied in these negotiations from the receipt of the first design until the Council's approval was issued was nearly six months, and, in the special circumstances, it has been agreed that a rebate of 218*l.* 10*s.* be made from the rent payable by the Government of Victoria.

THE "DRAWWELL" GRATE

WAS PLACED

First in the Final Tests

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjunction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public and private buildings.

N.B.—All Grates bear the Trade Mark and Name of "Drawwell" on firebrick to insure against imitation.

This Grate can only be supplied through Builders' Merchants, Ironmongers, &c., but Drawings and Particulars can be obtained from

J. & R. CORKER, Ltd.,

A MODERN INSURANCE BUILDING.

Among the many notable new buildings in and around Piccadilly must be included the new offices for the Norwich Union Life Insurance Society at the eastern corner of Piccadilly and St. James's Street, and of which Messrs.

Ernest Rüntz & Ford are the architects. We have already shown the elevation of these premises. From a constructional point of view they are of sufficient interest to repay a more detailed notice. The steel frame is so disposed that all loads from floors, walls and roofs are transmitted by steel girders to steel stanchions, which take their foundation below the basement. The floors are designed and constructed on the Somerville system, which has been employed in many important buildings and which the architects had previously used on other works with satisfactory results. The general arrangement is shown clearly by the illustration, and consists of hollow reinforced concrete blocks, 3 feet 4 inches span, placed between rolled-steel joists of section suitable for the span and load; good clinker concrete is then filled in on top of the tiers, and brought to a level surface ready to receive the wood-block flooring. The concrete tiles are moulded at Messrs. D. G. Somerville & Co.'s works, being thoroughly matured and seasoned. Each tile is reinforced with a frame of $\frac{3}{16}$ steel rods so designed as to take up the bending and shearing moments. Every tile is guaranteed to carry a load of 3 cwt. per square foot, and we are informed, has been tested up to 19 cwt. per square foot without destruction. The bottom of the concrete tiles projects below the soffite of the steel joists, so giving absolute protection to the steel and forming a level ceiling. The soffites are all scored ready to receive the finishing coats of plaster, which saves the trouble and expense of hacking. In the design of the steel frame of the building considerable economy was effected by the extreme lightness of the floor, which, including the steel joists and concrete filling, only weighs 35 lb. per foot super, against 65 lb. for a solid concrete floor. An interesting feature in the construction of the building was the speed with which it was erected, and this was mainly because no interior scaffolding was used; the floors not requiring any centring were constructed immediately the steel framing was fixed; the builders used them in place of scaffolding, openings being left here and there for hoisting up materials.

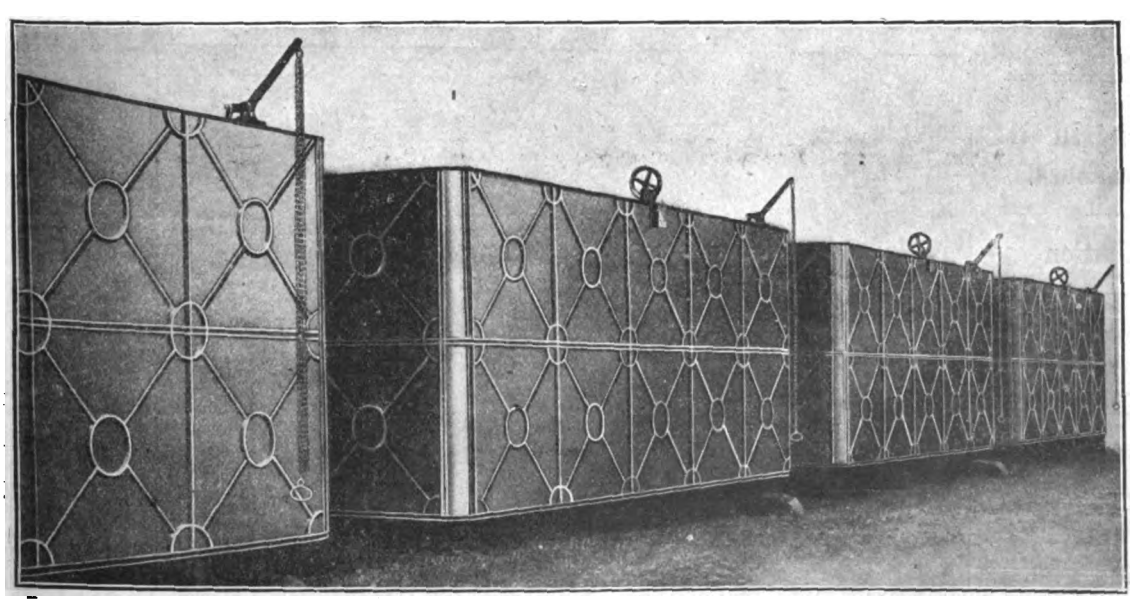
Where a reinforced concrete floor pure and simple is used one of the great difficulties is the amount of centring and strutting required, which cannot be removed under three weeks to a month, and during this time no load must be placed on the green concrete.

Again, once a reinforced concrete floor is set it is a matter of the greatest difficulty and of very considerable risk to make openings or any considerable structural alteration. In Messrs. Somerville's system it is simply a question of trimming the steel joists or for a small opening for removing one of the concrete tiles. In addition to the great strength of this flooring and general economy owing to the reduction in dead weight, a very important advantage is obtained by its soundproofness. The continuous air-spaces which extend inside the floor from wall to wall break up and lose any sounds, unless, of course, of a very exceptional character.

NEW CATALOGUES.

ALTHOUGH the Carron Company this year celebrate their 150th birthday, their two latest catalogues fully substantiate the company's motto, "Esto Perpetua." One catalogue is given up to selected designs for mantel-pieces and mantel register grates with and without overmantels. In it a page is devoted to a clear illustration and a detailed specification of each grate or mantelpiece showing a wide variety in price and design. The second catalogue is a general list, which might be headed "A few of the things made at the Carron Works." It gives prices for their iron air bricks, lavatory fittings, earth rammers, ranges, street tobys, ornamental tables, baths, grates, &c.



"DOULTON'S" and public health are closely linked in a hundred different ways. They have recently issued a twenty-four page pamphlet to explain their patent mixing valve, which is so designed as to supply a constant stream of water to the required temperature by the movement of one handle, and so constructed that the cold water must pass through first. The mixing valve is already in use in public baths, hospitals, asylums and infirmaries in England, Ireland, Scotland and Wales. No less than nine varieties have been made for the different requirements of operating-rooms. In every case the temperature can be nicely regulated by the user by checking or increasing the flow to the mixer from the hot and cold supply pipes. It is also applied to a rain or shower bath, douche-room fittings, massage under water and other ingenious uses. The price given in the list for a "Doulton's patent non-concussive mixing valve with lever handle, dial plate and wall plate with unions for lead in polished brass" is 3*l.* 7*s.*

PARNALL & SONS were recently faced with the pleasant necessity of enlarging their works and introducing electric machinery if they desired to cope with their orders for shop fronts and interior fittings. No one will disagree with their assertion that "shop fronts and fittings should be designed to harmonise with the location. They should be both striking to the eye and yet pleasing. The space at disposal should be employed to the best advantage, giving facilities for prompt service whilst lending themselves to effective display." Messrs. Parnall achieve this in some of their designs for shop fronts by setting back the main line of glass and shaping it to a quarter circle at the angles with the wall. In fronts and fittings there is frequently a rounding off of the hard right angles (of which we all have had too long experience) by using bent glass. The firm produce also highly creditable wrought iron and other accessories for the equipment of jewellers' shops.

ALTHOUGH the Pooley weighbridge has been in demand by railway companies ever since railways began in this country, Messrs. Henry Pooley & Son, Ltd., Birmingham, have not been unmindful of the requirements of smaller customers. They manufacture weighing apparatus of all types for all purposes. Their latest "No Loose Weight Steelyard" has been designed to overcome objections raised against various forms of "No Loose Weight Steelyards" hitherto in use, as well as to meet the requirements of the Board of Trade Regulations, 1907.

DENNISON, KETT & CO., LTD., in making revolving shutters to be one of their specialities, have done it with thoroughness. Their list gives particulars of ten patterns including lath shutters of convex wood, bevel wood, and flat iron and curvilinear iron, corrugated steel, and other varieties with different fittings. Illustrations are also given

of the various plans of arranging the coils. It is advised that provision be made so that ready access may be obtained for oiling the shutters or removing them for repairs. The best way to do this is to have the casings or facias screwed or hinged. The firm have special machinery for the manufacture of their improved collapsible steel gates. In these gates the diagonals are fixed in a solid cross head instead of in loose slippers, so as to give rigidity and noiselessness. The other specialities given in this list are pavement lights and electric motors.

"THE Construction of Modern Factories" is the title of a 16-page illustrated pamphlet issued by Mr. W. H. Brown, M.S.A., consulting structural engineer, Standard Buildings, Leeds, for the purpose of showing his patent reinforced concrete skeleton system. Mr. Brown brings to his work an experience extending over fifteen years in factory construction, and he now employs a staff of fully qualified engineers. His ideal factory is one where the columns, floors, foundations and roof are of reinforced concrete to his own system with cavity storm walls reinforced by wire mesh netting and reinforced brick partitions. The floors and roofs are of reinforced concrete with hollow tubes inserted. These floors have been constructed to carry a load of 17 cwt. per foot super, with 10 feet clear spans. A further safeguard against fire which is warmly advocated is the installation of an efficient electrical fire alarm throughout. The pamphlet gives plans and sections of a large factory erected on the principles advocated by Mr. W. H. Brown, who will personally advise on the construction and protection of all factories and mills.

IT may be well to briefly explain the character of "Monolithic Brickwork" as it is a fairly recent arrival in the building trades, although the majority of our readers probably have already seen it, if not already used it. A more precise name would be "Wire-Reinforced Brickwork," for it consists of the embedding in the mortar joints of a steel wire mesh 2 inches and 2½ inches in width, with four straight tensional wires running its extreme length. This mesh forms a continuous bond, makes the mortar become the strength of the brickwork, and renders the brickwork "monolithic." Tests have proved that a cavity wall made up of an outer wall of 4½ inches, brick reinforced, and of 3 inches (brick on edge) reinforced inner wall, has a greater strength than a 9-inch concrete wall. Messrs. Richard Johnson, Clapham & Morris, Ltd., of Manchester, the sole licensees, give in the first portion photographs and descriptions of tests. Photographs show monolithic brickwork in actual use as 3 inch and 4½ inch partitions, and 9-inch cavity storm walls in a large factory; designs for a 130*l.* cottage with cavity walls are included. It is said "a hollow 9-inch reinforced storm wall is cheaper than a 9-inch solid wall, and has all the advantages of a 14-inch cavity wall at one-third less cost." But the present catalogue is lacking in the matter of estimated prices. In one test a piece of wall forming a 5-feet cantilever resisted a load of 3,360 lbs. The last portion of the catalogue is headed "The Clothing of Reinforced Concrete Buildings," and shows the combination of monolithic brickwork walls and partitions with the concrete skeleton. This is done by partly inserting the H.B. Bonding Wire in the concrete during its construction, and building the loose ends into the brickwork.

A COMPANY has been formed and a prospectus issued under the title the "Girls' College Association, Ltd." Subscriptions are invited for 5,000 shares, out of the nominal capital of 10,000 shares of 5*l.* each (50,000*l.*). The chairman of the governing body is Sir George Hayter Chubb. The governing body are in negotiation with the Hon. R. Marsham-Townshend for a portion of the Scadbury Park Estate, Chislehurst, which will be the site of the projected college, and which is situated 1¼ mile from Chislehurst Station, and within fifteen minutes' walk of the Chislehurst Wesleyan Church. Messrs. Gordon & Gunton are the architects, and as soon as the purchase money (9,000*l.*) has been paid plans will be prepared for the erection of the school buildings, laying out the ground, playing fields, &c.

THE Ayr Town Council have agreed that the three shops situated on the Auld Brig belonging to the Corporation should be pulled down and added to the approach of the bridge. These shops did not form any part of the original structure of the bridge, and the premises were not in good condition. The Auld Brig Preservation Committee, it is understood, will be at the expense of taking down the buildings and erecting a suitable parapet wall.

CRISPINS, BRISTOL,

On the mixing of

Hall's

Sanitary
Washable

Distemper

¶ The stiff material is sold in tins and iron kegs.

¶ This only requires the addition of water to be ready for use.

¶ Cold water can be used, but warm water is better.

¶ Mix to the consistency of a thick cream, and apply in this way.

¶ Do not imagine that the more water you mix with the Distemper the further it will go; this is wrong.

¶ Remember the right consistency is that of a thick cream or oil paint. Used in this way, you will find one coat is in most cases sufficient, even on new work, and will give a result equal to two coats of oil paint.

¶ Five pounds of Hall's Distemper properly used will cover about 20 square yards.

¶ The modern style of decoration with Hall's Distemper walls, with Picture Rail, "Sisco" White Japan for the woodwork, and Hall's Distemper frieze is in popular demand. It is a quick and money earning decoration, and makes highly satisfied customers.

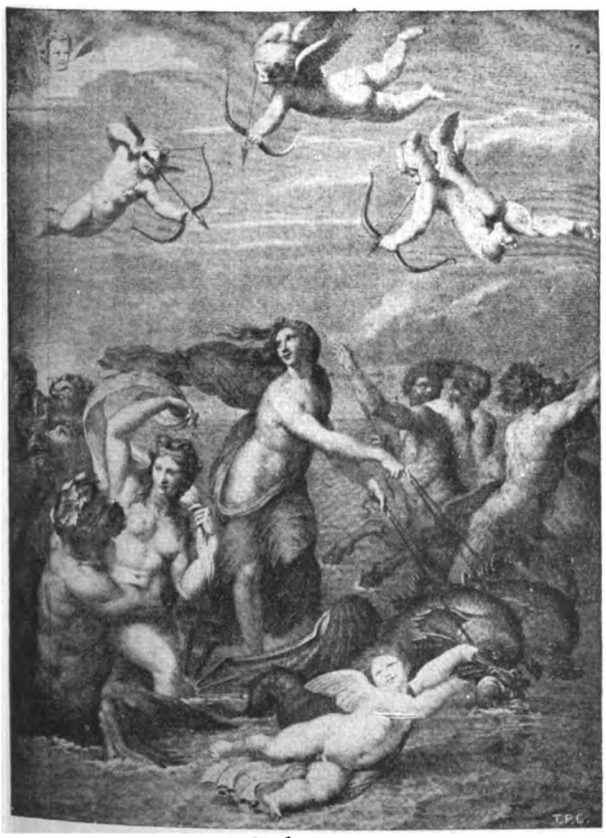
Art Plates from "The Architect."

AWARDED GOLD MEDALS, INTERNATIONAL HEALTH EXHIBITION AND ARCHITECTURAL AND BUILDING TRADES EXHIBITION (1889).

PROOFS on PLATE PAPER of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form on proof paper suitable for framing.



***The Corn Field.*—(1) Ploughing; (2) Harrowing; (3) Mowing; (4) Carting; (5) The Products of the Corn Field.**

In Five Separate Plates. Total Length, 14 ft. 7 in. by 15 in. deep. A splendid example of Colour Work in Permanent Ink Photo. By M. PAUL ALBERT BAUDOIN. This magnificent Illustration was presented to the Subscribers to "THE ARCHITECT," in 1886. A few proofs were taken which immediately became out of print.

OPINIONS OF THE PRESS.—"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition has been issued."—*The Lady's Pictorial.* "They are beautifully done in colours by the permanent ink-photo process and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—*The Stage.* "The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour work in permanent ink photo by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic and would grace the walls of any house."—*The Gentlewoman.* AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates they have been reproduced by Subscription at Half a Guinea the Set, free by post, carefully packed inside patent roller, and are now ready for issuing. Immediate application is requested. May be had framed in Black Reeded Frame with Gold Mounts, price Three Guineas the Set of Five Pieces.

Galatea.

From the Painting by RAPHAEL in the Villa Farnesina, Rome. Size 30 in. by 22 in. Price Two Shillings. Free by post, carefully packed inside patent roller.

St. George.

From the Painting by RAPHAEL, in the Louvre. Size 15 in. by 20 in. Price One Shilling and Sixpence. Free by post, carefully packed inside patent roller.

May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON'S Bookstalls, or from the

"THE ARCHITECT" Series of

British Colleges

OXFORD

The late Matthew Arnold never tired of referring to Oxford, his *alma mater*. "Beautiful city!" he exclaimed, "So venerable, so lovely, so unravaged by the fierce intellectual life of our century, so serene! And yet steeped in sentiment as she lies, spreading her gardens to the moonlight, and whispering from her towers the lost enchantments of the Middle Ages, who will deny that Oxford, by her ineffable charm, keeps ever calling us nearer to the true goal of all of us, to the ideal, to perfection—to beauty, in a word, which is only truth seen from another side."

The following illustrations, which were published on the dates mentioned, can be purchased at 4*d*. each from Messrs. Gilbert Wood & Co., Ltd., Imperial Buildings, Ludgate Circus, E.C.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

Mr. C. Harrison Townsend, F.R.I.B.A., has prepared the plans for reconstructing the Church school at Penn, Buckinghamshire, at a probable outlay of 1,300*l*.

The number of houses erected during the first ten months of 1908 at Coventry was 1,047. The number for the twelve months of the preceding year was 1,010. In 1898 the total was 501.

Mr. Spurr, city engineer, York, has been instructed to prepare a detailed report of what would be required to put the present Exhibition Buildings into a satisfactory state, and also to estimate the cost of a new building capable of seating 3,000 people. The buildings were recently shut as unsafe.

In his new book, "All about Investment," published by the *Financial Review of Reviews* at 2 Waterloo Place, Mr. Henry Loewenfeld points out that there are two classes of investors, the nervous and the over-confident. It would be interesting to know which of these two suffers the greater losses of capital. One of the chapters is devoted to the "Indispensable requisite towards successful Investment." "All about Investment," by its pointing out of the happy *via media* between nervousness and over-confidence, should act as a stimulant to the one and a warning to the other. Written simply and lucidly, so that its 280 pages are packed with information, advice and counsel, the new manual may well become guide, counsellor and friend in paths which without such aid are apt to prove slippery to the uninitiated.

BUILDING AND BUILDERS.

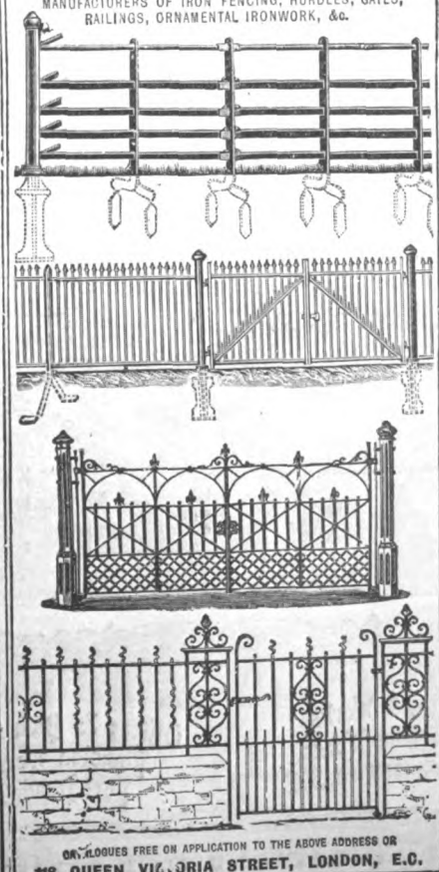
THE sanitary committee have been authorised to proceed with a scheme for the provision of public slaughter-houses on a site in Roushill, Shrewsbury.

THE National Federation of Building Trade Employers of Great Britain and Ireland intend holding their half-yearly general meeting at Portsmouth this summer.

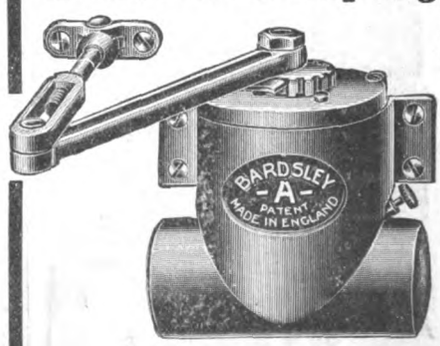
THE Glasgow Trades Council have agreed that a deputation should wait upon the Corporation tramways committee and urge upon them the advisability of having all buildings under their control erected by their own workmen, instead of placing these in the hands of private contractors.

"THE Tenements of Berlin" forms the subject of an illustrated article in *Harper's Magazine* for February, from which it appears that those who cannot build of stone use a cheap brick which meets the requirements of the fire department and can be covered with plaster to take the inevitable sculpturesque motive.

THE Girls' High School at Lincoln is to be enlarged, at a cost of 6,000*l*. The work includes the provision of four new class-rooms, three new music-rooms, two Kindergarten rooms, one science room, one art room, together with the necessary cloak-rooms, &c., and the conversion of several existing rooms for special purposes, such as stores, library, lavatory, &c.



THE ratepayers of Girvan, N.B., have formally approved of the plans prepared by Mr. Jennings, architect, Canterbury, for a new town hall which is to be presented to the town. The building will consist of three floors. On the first will be the Council chamber and the principal hall, which, with the stage and gallery, will seat 752 persons, and on a special occasion 1,000. On the ground floor will be the police-court and committee-rooms, waiting-rooms, and lesser hall suitable for small meetings and social gatherings, and will accommodate about 240 persons; while in the basement will be waiting-rooms, kitchen, heating apparatus, &c.



AT the last meeting of the Council of University College, Dundee, it was reported that draft plans for the new mechanical engineering laboratory had been prepared by Sir Rowand Anderson and submitted to the works committee, and were at present being amended in accordance with suggestions by the committee. This laboratory is to cost 15,000*l*. or 16,000*l*. Of this sum 10,000*l*. is to be provided by the Carnegie Trust and 5,000*l*. by the college. The tenders for wiring for the electric lighting in the new physics laboratory were submitted. The lowest was by Messrs. Steinthal & Boydell, Ltd., amounting to 353*l*., and it was accepted.

AT West London Police Court, Mr. Lane, K.C., gave his decision on a summons taken out against the Hammersmith Distillery Company by Mr. A. P. Stokes, district surveyor for North Fulham, who claimed 16*l*. as fees incurred in surveying certain alterations at the distillery. The alterations only took place in one corner of the company's works, but the surveyor claimed that that part of the distillery was inseparable from the whole works, and that he was entitled to take the whole area as the basis of his calculations as allowed by the Building Act. The defendants contended that the process of distilling was carried on in separate buildings, and that those separate and distinct buildings could not be described as one building under one roof within the meaning of the Act. Mr. Lane, K.C., decided against the surveyor and dismissed the summons. He did not grant costs.

AT last week's meeting of the Glasgow Corporation the gas committee recommended the leasing for ten years of premises in Sauchiehall Street for the exhibition of gas appliances, the lease of the premises in Union Street, which had been used for that purpose, expiring at Whit-Sunday. A letter was read from the Glasgow and West of Scotland Plumbers' Association, stating that they considered that proposal a further encroachment on the interests of the members of the plumbing and ironmongery trades; and, further, that it was against the spirit of the agreement which was come to between the gas department and the Master Plumbers' and Ironmongers' Associations in December, 1907. They therefore asked that the passing of the minute be delayed until the committee of the association had an opportunity of laying their views before the gas department. A letter in similar terms was sent by the Glasgow and West of Scotland Ironmongers and Allied Trades Association. Consideration of the minute was postponed for a fortnight.

SAVE 50% OF YOUR COAL BILL
BY USING THE PATENT
"Sine Qua Non" KITCHEN RANGE.
Recent Testimonial.
DEAR SIRS,—The "Sine Qua Non" Range you made for us is a great success. It cooks perfectly and we get any quantity of hot water for bath, lavatory and sink, and the consumption of coal is less than half compared with the old Range.
The use of the slow combustion arrangement not only effects this saving but is a great comfort to the cook in protecting her from the heat of the fire, and in keeping the kitchen cool.
Yours faithfully, (Signed) J. T. GREEN.

THE general purposes committee of the London County Council report on the subject of the future execution of jobbing works and of the shoring and hoarding works connected with dangerous structures, that they have approved the following proposals as a basis on which the several contracts shall be framed. Three separate forms of contract are necessary, viz., for architectural works, for engineering works (excluding works of a mechanical character, which will in any case have to be dealt with quickly by the firms most experienced in this class of work) and for hoarding and shoring works (dangerous structures). For jobbing works they have arranged that tenders shall be invited by public advertisement for the execution, for a period of three years, subject to six months' notice on either side after the expiration of the first year, of architectural and of engineering works respectively, either within the whole county, or within either of the districts north and south of the Thames, the Council reserving to itself the right to accept a tender for either description of work within either the whole county, or one or other of the districts. As regards hoarding and shoring works, they have arranged that tenders shall be invited from thirteen firms of repute selected by them; that the contract shall cover the execution of all works within the county, and shall be triennial, subject to the same conditions as to termination as the jobbing works contracts.

THE work under the contract dated February 24, 1904, between the London County Council and Messrs. Price & Reeves for the construction of Rotherhithe tunnel has been completed, and the measurements and accounts have now been settled. The total amount of the contract was 1,088,484*l*. 16*s*. 1*d*. This included provision money for certain definite objects and 100,000*l*. as general provision. This latter sum was intended to cover such matters as electric lighting, drainage pumps, &c., in addition to the ordinary extras which arise in a contract of this kind. Certain claims by the contractors for additional extra works were settled by the Council's chief engineer at 8,145*l*. The electric lighting of the tunnel cost 10,350*l*. 2*s*. The principal other extra items and their cost were as follows—granite entrance arches to "cut and cover," 4,196*l*. 17*s*.; additional paving works in Horseferry Branch Road, 2,115*l*. 18*s*. 5*d*.; gauge arches at entrances to tunnel, 1,948*l*. 15*s*. 4*d*.; motor generator house, stores, office, &c., 1,636*l*. 18*s*. 6*d*.; Portland stone cornice, &c., at shafts Nos. 1 and 4 and granite mouldings in shafts, 1,473*l*. 4*s*. 8*d*; drainage pumps, 1,225*l*. 6*s*. 7*d*.; foundations for Messrs. Hubbuck's new buildings in Broad Street, 1,025*l*. 12*s*. 11*d*.; house for superintendent, 870*l*. 18*s*. 3*d*.; rendering walls of open approaches, 649*l*. 4*s*.; and repairs to the river wall at New Star Wharves, 387*l*. 7*s*. 9*d*. The chief engineer has certified that all the works under the contract have been completed. The final settlement of the accounts shows that the total amount to be paid to Messrs. Price & Reeves under the contract is 995,809*l*. 6*s*. 8*d*., a saving of 92,675*l*. 9*s*. 5*d*. on the contract sum. This result is regarded as very satisfactory, and as reflecting the greatest possible credit on all concerned.

TRADE NOTES.

IN our description of the Norwich Union Assurance's new premises at the corner of St. James's Street and Piccadilly, last week (now nearing completion from the designs of Messrs. Rüntz & Ford), we omitted to mention that the general contractors are Messrs. Patman & Fotheringham, Ltd., Theobald's Road, W.C.

THE Isolation Hospital, Worthing, is being supplied with Shorland's patent Manchester stoves with descending smoke flues, Manchester grates, exhaust roof and special inlet ventilators by Messrs. E. H. Shorland & Brother, of Manchester.

ST. BEGA'S SCHOOLS, West Hartlepool, erected from the designs of Mr. Edward J. Kay, architect, Norton-on-Tees, have been ventilated by means of Mackay's patent direct-acting ventilators, supplied by Messrs. Cousland & Mackay, ventilating engineers, Glasgow, the sole makers.

THE Burnley Corporation having erected new tramway offices in the centre of the town, have given instructions to Messrs. Wm. Potts & Sons, Ltd., clock manufacturers, of Leeds and Newcastle, to erect an illuminated turret clock, showing the time upon two large external dials, which will be lighted by electricity and turned on and off automatically by an electric switch. The dials will be fixed on a metal drum resting on iron brackets. The clock should be a great boon to the public at this busy centre, and is to be fixed at an early date.

2.—DESIGN FOR GLAMORGAN COUNTY HALL, CARDIFF.—ELEVATIONS AND SECTIONS—PLANS.

THE inventor of the Hawksley Tread, now manufactured by the Andrews-Hawksley Patent Tread and Engineering Company, should be considered as a public benefactor, for who can estimate the number of accidents which have been prevented by his rigid oak blocks, which offer so safe a foothold? Old folk are extremely liable to serious injuries, especially in the rushing which is usual in railway stations. But the Hawksley blocks take a long time to become smooth, and then they can be easily removed, and under the new system can be reversed. They can not only be used in iron frames, but they can supplement stone and concrete steps. In several buildings such as the Corn Exchange, London, power stations, and where there is much traffic, they are applicable. One of the most useful of their adaptations is to coal plates. In too many streets iron plates are allowed to remain until their smoothness becomes a risk to those who step on them. Last year their improved treads were introduced, and as they had been laid down at Windsor Castle and Sandringham, and in many public buildings, the security they offer is confirmed by unquestionable evidence.

ON Tuesday afternoon there arrived at the headquarters of the London Fire Brigade a new petrol motor fire engine, which is the first of its kind to be put into service in the Metropolis. However, a second engine of exactly the same design is practically completed. The new machine, which is of Merryweathers' patent "Hatfield" pattern, pumps 500 gallons of water per minute, and can attain a speed of 30 miles an hour on the level, whilst any hill in the London district can be negotiated. The pump is driven by the same motor as propels the vehicle, the power being transferred from the road wheels by the movement of a single lever. It is specially adapted for working from deep lifts, and will draw water in a few seconds from a depth of 27 feet without priming devices. With its capacity for instant turn-out, its high rate of speed, and its powerful pumping capabilities, this latest acquisition should certainly prove a valuable addition to Captain Hamilton's rapidly increasing motor equipment.

VARIETIES.

THE Isle of Wight education committee have approved a scheme for the erection of a Council school to accommodate 210 pupils at Brading. The cost is estimated at 3,000*l*.

THE Liverpool justices will on Monday next consider a scheme for rebuilding the Dale Street police court at an estimated cost of 35,000*l*.

AN informal dinner was held at the Criterion Restaurant, Piccadilly, London, W., on the 9th inst., at which the formation of an Illuminating Engineering Society in this country was the subject of discussion.

THE Manchester gas committee propose to take over the supply and maintenance of incandescent gas-fittings and mantles. A deputation of plumbers and other tradesmen waited on the committee on Friday.

THE Ormesby Urban District Council have instructed Messrs. D. Balfour & Sons to prepare the necessary plans, specifications, &c., in order that the Council might be able to apply to the Local Government Board for sanction to raise a loan of 6,000*l*. for a new main drainage scheme.

AT a meeting of the Employers' Parliamentary Council held at Westminster, a resolution was adopted in support of the following motion which the Earl of Wemyss will bring forward in the House of Lords in the forthcoming session:—(1) That in the opinion of this House it would be for the public good that important national trading and other organisations and societies should each name three peers in the current and each succeeding Parliament to speak and act on behalf of such societies in all questions in which they are interested, and that the names of the peers so nominated be entered in the Journals of the House. (2) That the Lord Chancellor, the Marquess of Lansdowne, the Earl of Crewe, and the Earl of Halsbury be empowered to determine what societies are of sufficient importance to be admitted to the said privilege of nomination. (3) That no peer shall be entitled to vote on any public question who has not attended twenty sittings in the current or previous session of the House.

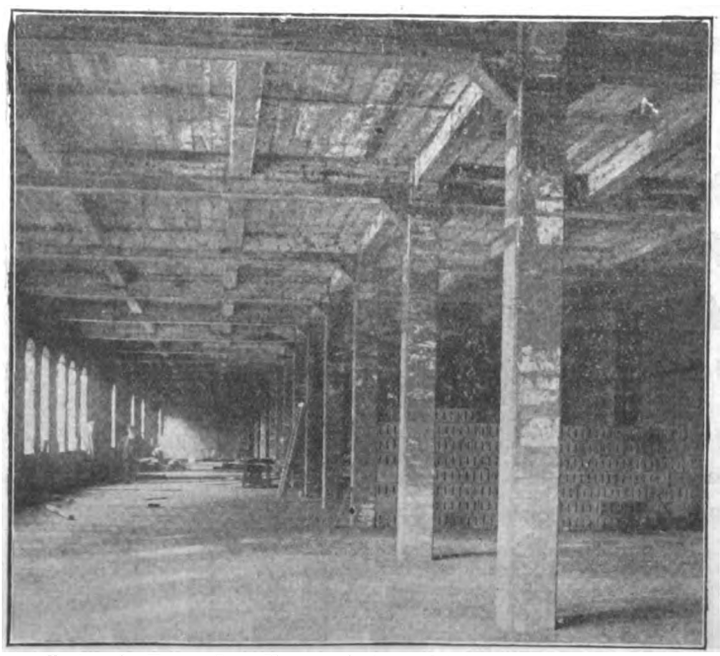
THE Newport works committee recommend the appointment of Mr. Butler, M.I.C.E., of Swindon, as assistant engineer for the supervision of private improvement works. The salary is 130*l.* a year. At the same meeting Mr. J. Dix's tenders for the improvement of Castle Street and Corelli Street were accepted, and that of Mr. Vincent for Somerset Road.

A MEETING of the shareholders of W. T. Tyler & Co., Victoria Mill, Horwich, was held recently to consider schemes submitted by the directors for the extension of the shed and increasing the number of looms. If one scheme is adopted, doubling the capital to 30,000*l.*, a warehouse would be built and the shed extended to hold 500 looms, but at first only 150 will be added to the present 200. The scheme was favourably received, and a special meeting of the shareholders is to be called, when the scheme will be submitted for their approval.

MESSRS. MOUNTAIN & GREGORY, railway and tramway engineers, are to establish their works at Burton-on-Trent. The proposal includes the absorption of the business of Thornewill & Warham, ironfounders, which the new company propose to carry on in conjunction with their own. The men already employed at Messrs. Thornewill & Warham's will be kept on, and it is understood that the new firm will bring their skilled labour with them. In all, it is expected that work will be found for some 500 to 700 people. When the project was first mooted some six years ago it was stated that the outlay would be 53,000*l.* for the reconstruction of the works.

MR. BANISTER FLETCHER will give seven public lectures on "English Renaissance Architecture" (illustrated by lantern slides, photographs and diagrams), at the University of London, Imperial Institute Road, South Kensington, S.W. The first lecture was on Monday, the 15th inst. These lectures will include the most famous Elizabethan and Jacobean mansions, the works of Inigo Jones and Sir Christopher Wren, and the most prominent examples in the Queen Anne and Georgian styles, including those by eighteenth-century architects such as the Brothers Adam, Hawksmoor, Sir John Vanbrugh and others.

AN interesting feat was carried out at the south yard of Messrs. Workman, Clark & Co., Ltd., shipbuilders, Belfast, on February 13. To provide more headroom in the lower part of the joiners' shop, the building, which is 230 feet long, was raised to the extent of 3 feet. The operation was performed by means of powerful hydraulic jacks distributed around the shop. These having been placed in position, a signal was given, when the lifting process began, and the wooden building began to rise inch by inch. The simultaneous leverage elevated the structure at the rate of an inch each five minutes, and at noon the work was completed to the satisfaction of those in charge. Not a single item of machinery inside the four walls was disarranged or disturbed, and everything on the ground and upper floors remained as usual.



AT the Kingston County Bench on Thursday a house-owner was summoned at the instance of the Walton Urban District Council to abate a nuisance. It appeared the tenant drew the Council's attention to the house, and their inspector found that there was extensive decay in the floors; that they were wet, crumbling in the joists, which were so rotten that they could be broken away with the finger. He contended that rotten floors, which might be penetrated by a foot or the leg of a chair, must necessarily be a nuisance. The trouble was caused through there being an insufficient number of air bricks. The sanitary inspector to the Council, under cross-examination, agreed that linoleum did help to rot boards; but he did not agree that, no matter how many air bricks were there, the linoleum would cause the boards to rot. The medical officer of health said he was of opinion a nuisance existed injurious to health. For the house-owner it was submitted that, supposing there was an absence of air bricks, that did not constitute in any sense a "defective or want of structural convenience." The rotting, counsel argued, was not set up by lack of ventilation at all, but by the placing on the floors of linoleum. His client was contesting the case not to escape any obligation, but in the interests of an enormous number of property owners in the district. The magistrates found that air bricks were "structural conveniences," and that the nuisance had arisen in that case from insufficient ventilation. They made an order accordingly. The defendant asked the magistrates to state a case, and this was agreed to.

THE Surbiton District Council have again failed to obtain the approval of the Local Government Board to their sewage disposal scheme. An application was made last July for sanction to a loan of 60,000*l.* for a scheme which superseded one that the Local Government Board had already refused. The new scheme was drawn up partly on lines suggested by the Local Government Board. In a communication which has just been received the Board allege that there has been want of care and foresight in the preparation of the drawings, specifications and bills of quantities, and say that these are in various respects incomplete and defective. The drainage committee of the District Council, in reply, pointed out that the matters to which exception is now taken were approved of in the previous scheme by the Board's own inspector. The committee ask the Board to receive a deputation on the matter.

THE finance committee of the Hammersmith Board of Guardians reported recently on the settlement of accounts incurred in connection with the new workhouse and infirmary buildings, the expenditure on which, it will be remembered, was the subject of a Local Government Board inquiry eighteen months ago. It appears that the total actual expenditure was 259,036*l.*, and that the amount sanctioned by the Local Government Board was 254,686*l.*, the amount paid in excess being thus 4,350*l.* Several items, amounting in the aggregate to 1,725*l.*, could not properly be charged against a loan, and a balance of 2,625*l.* was thus left which could be so raised. However, the Guardians decided not to make application for a loan for this sum, as all amounts have been paid, but that the Local Government Board be only requested to sanction the excess expenditure of 3,079*l.*, that being the sum of 4,350*l.*, less 1,271*l.* recovered from the architects. The items of expenditure and total amounts actually paid in full discharge were:—Site, 14,528*l.* 3*s.* 6*d.*; structure, 196,965*l.* 18*s.*; laundry machinery, 3,503*l.* 2*s.* 3*d.*; cooking appliances, 1,887*l.*; electric lighting, 7,593*l.* 19*s.* 8*d.*; boundary wall, 3,358*l.* 14*s.* 10*d.*; road-making, 2,328*l.* 14*s.* 6*d.* and 2,866*l.* 5*s.* 6*d.*; furnishing, 6,549*l.* 5*s.* 11*d.*; equipment, 8,213*l.* 13*s.* 6*d.*; architect's fees (original claim, 8,536*l.*), 7,500*l.*; quantity surveyor (original claim, 4,343*l.*), 2,352*l.* 18*s.* 3*d.*; clerk of the works, 772*l.* 16*s.*; rough levelling, 400*l.*; cost of raising loan, &c., 216*l.* 2*s.* 6*d.*; total, 259,036*l.* 14*s.* 6*d.*

A TESTING NEEDLE FOR CEMENT.

MESSRS. W. F. STANLEY & CO., LTD., Great Turnstile, Holborn, W.C., have added to their long list of instruments serviceable for architects, engineers, manufacturers, contractors and others a testing needle for accurately ascertaining and recording the initial and final setting time of Portland cement. The processes of producing cement tend more and more to the elimination of erring human agency. This idea is carried still farther by the new testing needle, for the results are achieved independently of the operator upon whose hand and powers of observation the results have heretofore depended. The aim of the inventor was that the results of his experiments should agree as far as practicable with the British Standard Needle at present in use, and further that the needle should be of such size and carrying such weight that whilst agreeing with the final set of the British standard specifications, it should also indicate and record the initial set of the same sample. The size needle decided upon is 1 mm. diameter, and carrying a total weight of 400 grammes. Another important point is the mould; this has 40 mm. diameter and 20 mm. deep.

It will be seen that at the side of the instrument is a screw surmounted by a small wheel, and that this screw carries a nut with a small projecting arm which bears the weight of the needle bar, but is in no way attached to the needle bar. The needle falls by its own weight; the screw and wheel are only to prevent any sudden dropping or pressure from above. The instrument is so adjusted that the pointer is on the dial at zero, with the needle just touching the surface of the cement mixture in the mould.

When the small wheel is rotated so as to lower the needle, the needle will at first, until setting commences, completely perforate the cement mixture in the mould, and the pointer will record the extent of the perforation as 20 mm. on the dial plate.

So soon as the needle fails to perforate the sample beyond 15 mm. as recorded by the pointer on the dial plate, then the initial set has begun.

The final set is ascertained in exactly the same manner, and when the needle fails to perforate more than 2 mm.

as recorded by the pointer on the dial plate, then the final set has taken place and the time occupied in both operations can be noted.

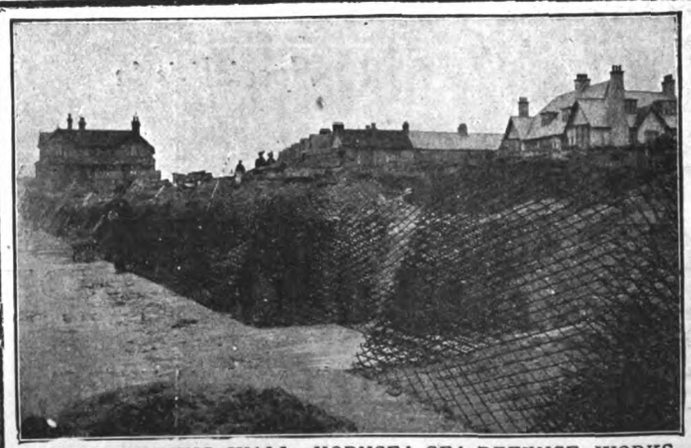
The reason that 2 mm. is fixed as the limit of perforation for final set is because in mixing up a sample of cement for testing, what may be termed a "scum" or cream rises to the surface, and this will continue to show a slight impression or perforation for some time after the real and final set of the cement has taken place.

The British Standard Needle gives slightly slower final set tests, but this is due to the difficulty in saying when the

impression ceases to exist, and particularly because the so-called "impression" is unduly prolonged owing to the existence of the "scum" or cream on the surface of the mould.

Perhaps the greatest difficulty that the cement tester has to cope with at the present time is the difference of opinion as to what constitutes "an appreciable impression," as made by the needle. The new instrument should be of great service in this respect. It is the invention of Mr. C. H. Watson, the managing director of Messrs. I. C. Johnson & Co., Ltd., of Greenhithe and Gateshead

PAINTING STRUCTURAL STEEL.*



Few engineers in this country, even those that are most stringent in their demands concerning physical and chemical qualities, make any surface inspection; yet flaws, flash, rust and grease are things that may destroy the work of the painter.

No surface of structural steel ought to be coated with paint unless it shows the greyish-white, natural colour of the metal, and is absolutely free from traces of adherent acids and moistures. Yet, when unsatisfactory results are obtained, the paintmaker is generally the first one to be criticised, though most probably he has applied a perfectly good and suitable paint.

Steel is perhaps the most tenacious of all known substances, having great cohesive force between its particles, so that they resist any effort to pull or force them apart; and as we fancy all matters to be in a state of motion at all times, the difficulty in preserving it by the use of paint is at once apparent. The defects in modern structural steel are largely due to mechanical working; that is, it is run out too hot or too quickly, and afterwards not properly housed and cared for.

The enormous increase of late in its use in building and engineering constructions demands increased vigilance and attention to its maintenance and present condition wherever it has been placed; as, either from corrosion, fatigue, vibra-

tion, or general deterioration, the metal may become so impaired as to be unfit to do that for which it was designed; and unless properly protected by coatings of paint at various periods those entrusted with its care will assume the enormous responsibility for further catastrophes.

Who knows whether the collapse of Charing Cross station a short time ago may not have been due to some such cause?

Rust.

Chemists are not definitely agreed as to the exact meaning to be attached to the term "rusting." To paint-makers and painters rusting must be understood to mean the atmospheric oxidation, and not corrosion by other agencies. Consequently, apart from chemical agents, water and oxygen are the primary causes of rust, with the contributory influence of atmospheric carbon dioxide (carbonic acid). Rust is hydrated oxide of iron; that is, a compound of the metal iron with oxygen and water; 100 parts ordinary iron rust containing 52 parts of iron, 22 parts of oxygen, and 25 parts water.

Water is here in a state of chemical combination, and not a mere mechanical adjunct in the form of moisture. Wherever rust has once formed, its further occurrence is a natural sequence; and its prevention becomes more difficult—in fact, impossible—unless the affected parts are perfectly freed from all traces of oxide. So far from being a solid, coherent mass, rust is loose and porous, absorbing and persistently retaining water, which, with the help of atmospheric air, assists in the conversion of such portions of the iron which have hitherto remained intact.

Again, it has been proved that hydrated oxide of iron is an energetic oxidising agent, and its power is, so to speak, illimitable, because of its recuperative capacity in contact with air; after parting with oxide to oxidisable substances—metallic iron, for instance—it is reconstituted, and in a position to give up a further quantity of oxygen. It is on this account that, in course of time, nails embedded in wood damage the portions in their immediate vicinity, and that fabrics spotted with rust quickly fall into holes. This continuous development of rust also furnishes a reason for the complete corrosion of rivets, screws, &c., in steel structures.

Rust has a tendency to grow and spread out from a centre; hence a small spot of it on the metal expands itself under the paint, so that in time the paint will be flaked off, and the metal will have expanded. It is therefore essential for the proper upkeep of the steel structure that all rust spots, of whatever nature, should be as early as possible prevented from spreading, and to this end they ought to be repaired at once, without waiting for all the old paint to disappear before laying on an entirely fresh coat all over.

It is a remarkable thing that a speck of rust will sometimes strike through a coat of paint like a smoke stain through distemper in a ceiling; and this is, of course, more visible when white paint is used. When this is dry it is seen that the rust has turned the paint yellow. It is most probably due to a certain percentage of water in a good many paints, though, of course, in a well-prepared paint this should not be the case.

Various authors have advanced the theory that electrolytic action is one of the agencies for rapid corrosion. Like all other chemical reactions, rusting is no doubt accompanied by electrical tension, set up in the affected objects. This is practically proved by the fact that in large steel structures the maximum amount of corrosion is to be found where two pieces of steel are attached together; this is especially noticeable round the rivet holes, bolts, and nuts; thus the necessity for greater care to be exercised in their painting.

An important point to be noted in the formation of rust is the increase in volume of the iron concurrently with the progress of the rust formation. Ironwork embedded in fresh mortar or set in brickwork soon becomes attacked at the surface, and gradually the corrosion extends towards the interior—a circumstance that may become a great danger to the structure; and yet almost daily all over this great city thousands of tons of steel girders are embedded without a particle of paint, or with a miserable coat of shop-paint given for appearance sake only, and having no protective value. Yet engineers and architects are supposed to draw proper specifications to protect their clients, and district surveyors are appointed to see on behalf of the public that structures are sound; but in many cases they seem to be unaware of the fact that in not insisting to have the steel structure carefully protected by several coats of paint they assume the responsibility of many accidents and catastrophes which may happen in years to come.

The Cleaning of Steel.

The cleaning of structural steel is a problem for engineers. Specifications are often very loose with regard to the manner in which the cleaning should be done before re-painting; when, as a matter of fact, no clause can be stringent enough, no inspection by the clerk of works too minute, when the importance of the cleaning of steel before the application of paint is taken into consideration.

Several methods are at present employed:—(1) Scrubbing or scouring with hard substances, such as pumice-stone, emery, &c.; (2) scrubbing with wire brushes, and chipping with chipping hammers or steel scrapers made of old files; (3) pickling with acids; (4) cleaning by the sand-blast process.

The first method of scrubbing and scouring cannot be recommended, as it necessitates the employment of water or petroleum oil, which are often used to facilitate the removal of the iron rust. It is highly probable that this is the cause of many failures, since the labourers generally entrusted with the cleaning of ironwork can hardly be expected to know the meaning of absolute dryness. When this method is employed a hot blast from a blow-lamp should be applied to the surface of the iron, to remove all moisture or burn off all traces of petroleum oil from its surface; but, unfortunately, this is seldom if ever put into practice on account of the expense of it.

The pickling with acids is undoubtedly the process by which a thousand times as much new iron and steel is cleaned than by any other process. All work that is to be electro-plated, for instance, or that is to receive a coat of vitreous enamel, is cleaned in this way. No doubt an efficient cleaning is obtained by pickling in hot sulphuric acid or muriatic acid; but unless one is well prepared to neutralise thoroughly, and remove all traces of acid from the metal immediately after it is taken from the "bath," the result will be disastrous.

Of all methods the cleaning by sand-blast seems to offer the most rapid, effective, and economical means of preparing structural steel to receive a coating of paint. It leaves the metal not only perfectly clean, but dry, an important and essential condition if a receptive surface is to be secured. The painting of the metal should follow immediately after the cleaning, as the cleaning of the steel by this process roughens its surface slightly, and it is well known that under such conditions surface corrosion rapidly sets in.

It is argued that one of the disadvantages of sand-blasting is the deleterious effect upon the eyes and lungs of the operator. This can easily be overcome by means of suitable respirators, various kinds being now obtainable which would insure complete immunity on that score. There is no doubt that sand-blasting offers the best means of cleaning old structures which are very rusty; and now that air-compressors, small oil engines, and electric motors of a portable kind are available, it is fair to presume that steel coatings will have better opportunities in the future to prove the life there is in them than they have had in the past; if the example that has been set before us by America for some years past is followed in England—to wit, the adoption of the method of cleaning by sand-blast.

(*To be continued.*)

CEMENT SALES IN EGYPT.

The recent observations of the Adviser for Public Works in Egypt emphasising the fact that the Portland cement employed in the construction of the Esneh weir, as well as the Assouan dam, has been consistently of British manufacture, give point, says the *Manchester Guardian*, to an investigation undertaken by the British Chamber of Commerce in Alexandria on the share England has obtained in the Egyptian cement trade during the past five years. In 1903 England contributed 15 per cent., France 40 per cent. and Belgium 35 per cent. In 1905 England sent 31 per cent., France 20 per cent. and Belgium 43 per cent., while by the end of 1907 the Belgian aggregate for the period was 126,522 tons to England's 73,798 tons, France's being 71,839 tons. The Chamber considers that Belgium has the chief hold on the Egyptian market to-day. It may be remembered that in his report for 1906 Lord Cromer referred to Belgian cement for use on public works in Egypt and the Soudan as being considerably lower in price, but in quality distinctly inferior to British brands. The Chamber of Commerce considers that this opinion is not fully shared by the Egyptian market in general and the State purchasing de-

partments in particular, for in a recent contract offered to public tender by the Egyptian State Railways for the supply of 6,000 tons of Portland cement, the specification being the British standard one, the order was divided between the Josson & Co. Belgian brand at 2*l.* 6*s.* 9*d.* per ton and the Russian "Caucasus" brand at 2*l.* 6*s.* 1*d.* per ton, c.i.f. on the railway quays in Alexandria. It is therefore to be assumed that other causes are in operation, and these the Chamber considers to be, first, the cheaper freights from Antwerp (8*s.* 6*d.* per ton, plus 10 per cent.) and Marseilles (8 francs per ton) as compared with that from London to Alexandria (about 12*s.*); and, secondly, the possibility that the leading Belgian factories are better equipped to produce the same article at less cost. The Chamber is of opinion, further, that British manufacturers are handicapped by the fact that both France and Belgium have more frequent sailings than London to Egypt, a disadvantage likely to increase if plans now under consideration mature for a new service of fast cargo boats between Antwerp and Alexandria.

WINDOW CLEANING IN GLASGOW.

A DECISION of interest to builders and householders has been given by the Glasgow Dean of Guild (Mr. M. Pearce Campbell). The Procurator Fiscal presented a petition to the Court as to the effect of certain provisions of the Building Regulations Act. The circumstances are brought out in the following interlocutor:—

Glasgow, February, 1909.—Having considered the closed record, and along with the trades liners and in presence of the parties inspected the windows in question, the Dean of Guild finds as matter of fact that the said windows are so constructed as to admit of the outside of the said windows being cleaned from the inside of the rooms: Finds in law that the windows in question satisfy the requirements of section 102 of the Glasgow Building Regulations Act, 1900, founded on by the petitioner: Therefore dismisses the petition: Finds the petitioner liable in expenses: Allows an account thereof to be given in: and remits the same when lodged to the Clerk of Court qua auditor to tax and report.

(Sgd.) M. PEARCE CAMPBELL, D.G.

Note.—In this case the question as to the effect of the provisions of section 102 of the Act of 1900 in regard to windows in dwelling-houses existing at the time the Act was passed is raised for the first time. The houses of the respondent were in existence at that time. It is not maintained that they do not come within the operation of Section 102. But it is maintained that the windows as constructed satisfy the requirements of the section.

In view of the likelihood of this case going further, the Dean of Guild thought it well that the parties should lodge an agreed-on description of the windows in question. A joint minute giving the dimensions of the windows has been lodged, and forms No. 6 of process. To that the Dean would add that the windows in question are double-hung windows which are opened by the top sash being pulled down and the bottom sash being pushed up.

The requirement of section 102 (5) is that all window sashes in dwelling houses and habitable rooms above the ground floor shall be so constructed as to admit of the outside of the window being cleaned from the inside of the room. The idea which underlies the enactment is, as everyone knows, the prevention of accidents in window cleaning. And it is a matter of common knowledge that, according to the views of some people, the only satisfactory mode of ensuring safety is the conversion of windows from the double-hung system to the hinged system. But however that may be, and however the idea may have been developed since the first general Police Act, the question here depends upon the construction of the enactment of 1900.

The case seemed to the Dean to be one which could be more satisfactorily dealt with by a judicial visitation than by an ordinary proof, and this view was accepted by the parties. The Dean accordingly of consent ordered an inspection, and he made that inspection along with the trades liners and in the presence of the master of works and the parties. The Dean found the windows to be as described in the minute. The respondents had in attendance a person who is a window cleaner by trade. It appeared to the Dean from his examination of the windows that the ordinary occupant of such a tenement might have difficulty in cleaning the outside of the windows from the inside of the rooms. But the window cleaner present at the inspection had no

Digitized by Google

difficulty in the matter. In the presence of the Dean and the liners he cleaned the outside of some of the windows while he himself remained in the inside of the rooms, and so far as the Dean and the liners could see he did this without any extra exertion or difficulty.

The petitioner argued that the enactment must be so construed as to be applicable to everyday and ordinary conditions, that every householder could not afford to employ professional window cleaners, and had to do his window-cleaning by members of his own household. But an enactment of the kind in question cannot be construed in this spirit. The section does not say the construction of the windows is to be such as to admit of the outside of the window being cleaned by a member of the household from the inside of the room. Whatever may have been the intention of the framers of the section, all that has been actually enacted turns upon the answer to the question—Is it physically possible in an ordinary way to clean the outside of the windows from the inside of the room? The exhibition of the window cleaner gave a clear affirmative answer to that question. The Dean is therefore of opinion and holds that the windows in question as presently constructed meet the requirements of section 102 (5) of the Act of 1900. The trades liners are all of the same opinion.

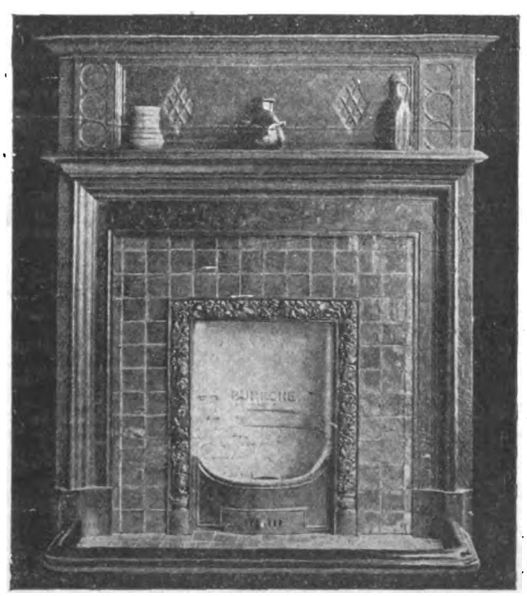
NORTHAMPTON POLYTECHNIC INSTITUTE.

For several years the work of the Northampton Polytechnic Institute has outgrown the accommodation provided in the buildings erected in 1896, and various schemes have been under discussion for increasing the accommodation. Eventually the necessary funds, amounting to 9,000*l.*, having been generously provided by the London County Council, it was decided to erect, in such a position as not to interfere with the access of light and air to the present buildings, a five-storey building in one corner of the courtyard and to complete the roofing of the remainder of the yard so as to give a basement floor occupying the whole of the area.

The grant was made by the Council in March 1908; plans, tenders and contracts were handled rapidly, and the work of erection commenced during the last week in May.

The official opening by the Earl of Halsbury of the courtyard extension took place on the evening of Friday, February 5, and the following is a brief description of the additional accommodation provided, in accordance with the designs and under the superintendence of Mr. W. Campbell Jones, the architect to the governing body, who has admirably utilised the somewhat awkward space placed at his disposal.

Commencing with the basement floor there is an extension of the mechanical engineering workshop. Adjoining this is a small room which will be utilised as an erecting shop for mechanical engineering work, and also adjoining it in the direction of the new building is a room which is to be utilised for experimental steam-raising and gas-producing plant. Further on, under the whole of the new building, is a large room, which will be equipped as a power laboratory. On the right of this room as entered from the mechanical engineering workshop there will be found an extension of the existing mechanical engineering laboratory, occupying part of the space of the courtyard.



On the ground floor are three large rooms, two of which are to be used for the meetings of scientific societies connected with the Institute and for the meetings of the Institute clubs respectively. The third room will be furnished and used as a common room for the staff, an extension of the Institute accommodation which has long been urgently needed. The two small rooms on this floor are for the accommodation of the Honorary Stewards' Association and the secretaries of Institute clubs.

On the first floor the additional accommodation provided by the new building is utilised almost entirely for a large lecture theatre, which supplies a long-felt need in the accommodation of the Institute. On the second and third floors there are suites of rooms, numbering thirteen in all, which have been fitted up as class-rooms. The rooms have been purposely planned to be of different capacities, so that they may accommodate economically the variously sized classes which are met with in the Institute's work. As class-rooms they will give very much needed relief to the overcrowded class-rooms in the other parts of the building, and it is hoped that next session some developments of the existing work which have been long contemplated will be proceeded with.

THE

Festiniog District Slate Quarry Proprietors' Association

THE Members constituting this Association, whose names are subjoined, beg to notify Architects and the trade that they are the producers of the genuine **Portmadoc Slates,** and would respectfully invite co-operation in discouraging the sale of other, and inferior, slates as such.

¶ The Members will be pleased to supply Acid, Water and Breakage Tests, with full Analysis; also a list of important Government and public buildings upon which their slates have been used during the past 100 years.

¶ Portmadoc Slates contain, according to analysis, only **1** per cent. of lime, whereas the imitation composite slates, now extensively advertised, show much variation; samples recently analysed contain upwards of **40** per cent. of this highly perishable subsiance, and are liable to an absorption of moisture **forty** times as great as that of Portmadoc Slates.

NEWMAN'S PATENT REGULATING HELICAL SPRING HINGES.

WITH PATENT STOP TO PREVENT OVERWINDING.
The power can be instantly taken off while the Hinges are being fixed and afterwards adjusted to close the door conveniently. They cannot be overwound.
Made in Brass and Iron, 3, 3½, 4, 4½, 5, 6, and 7 inches.

NEWMAN'S NORTON SYSTEM.
MADE IN MALLEABLE IRON.
The Best Door Spring and Check for closing doors without noise.
Pressure is direct, but diminishes pleasantly as door is opened.
Also made with Patent Regulator to latch stubborn bolts.

NEWMAN'S PATENT INVINCIBLE,
WITH AND WITHOUT PNEUMATIC CHECK.
Will hold door *rigidly to centre*, but diminishes in power as door is opened, allowing comfortable passage through.
The *Best* Spring to close door *against wind pressure*, and the most suitable for Banks, Schools, and other public buildings. Made in sizes to suit all doors.

Made solely by W. NEWMAN & SONS,
DOOR SPRING MAKERS AND BRASSFOUNDERS,
Established over 100 Years. **HOSPITAL ST., BIRMINGHAM.**

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

OF YOUR
COAL BILL
BY USING THE PATENT
"Bond" Stove
Recent Testimonial.
Chelmsford, 12th January, 1909.
DEAR SIRS,—I have very great pleasure in stating the "Bond" Stoves have given me entire satisfaction, and I have no hesitation in saying, that if I were purchasing stoves for a new house I should, with my present experience, have all the fireplaces fitted with them. Apart from the great heat generated, and thoroughly distributed about the room, they are most economical in coal consumption.—Yours very truly,
(Signed) WILLIAM F. GEPP.

HOLT & SONS, Birmingham (*accepted*)	£123 19 8

A TENDER has been accepted for the erection of a Baptist church and institute, Leavesden Road, Watford. The block is designed in a free treatment of Late Gothic. The facings will be in pressed red bricks and the dressings in Bath stone. The church is to accommodate about 700 persons. The architects, whose design was selected in a competition, are Messrs. George Baines & Son, 5 Clement's Inn, Strand, W.C. The contract, which amounts to 4,150*l.*, is let to Messrs. Brightman & Son, of Watford.

TRADE NOTES.

AN addition is being made to Messrs. Lingard's premises, Bradford. Mr. James Ledingham, F.R.I.B.A., is the architect. The floors are to be on the "Fawcett" system, and are being put in by Messrs. Fawcett & Co., of Westminster and Greenwich.

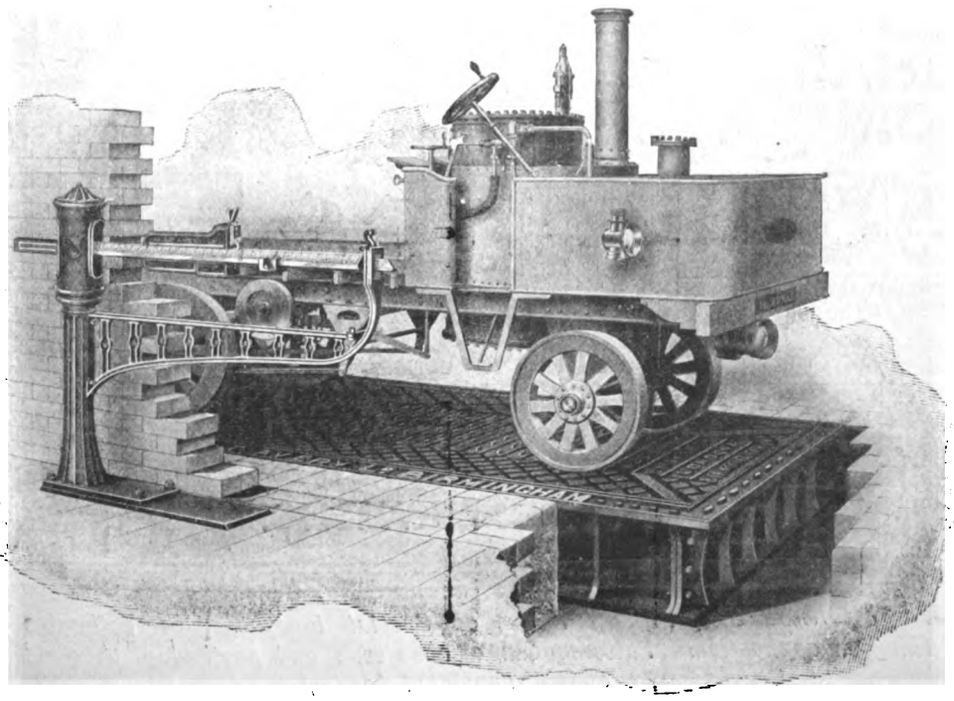
THE directors of John Oakey & Sons, Ltd., recommend the payment of a final dividend of 5 per cent. to the ordinary shareholders, making a total of 10 per cent. for the year, and in addition a bonus of 5 per cent. free of income tax, leaving a balance of 5,050*l.* 19*s.* 9*d.* to be carried forward to next year.

VARIETIES.

THE Westminster City Council have agreed that a number of streets be repaired during the coming year at an estimated cost of 30,903*l.* 10*s.*

FRASERBURGH Harbour Commissioners have decided to erect a store at the quayside for the convenience of local traders.

AT a meeting of the Society of Engineers next Monday, at the Royal United Service Institution, Whitehall, a paper is to be read entitled "A New Test for Concrete," by J. S. Owens, M.D., A.M.I.C.E.



MESSRS. LOVEGROVE & PAPWORTH, of 374-8 Old Street, E.C., architects and surveyors, have succeeded to the practice carried on for many years by the late Mr. J. H. Richardson, of 22 King Street, Hammersmith, W. Both addresses and telephone numbers will be retained.

THE Farnham (Surrey) Urban District Council have received a letter from the Board of Trade refusing an application by the Farnham and District Electric Lighting Company for permission to erect overhead wires in carrying out their Order to light the town by electricity.

THE tower attached to the St. John's parish church, Staveley, has been found to be in need of restoration, owing to the masonry and woodwork showing signs of decay. With the object of ascertaining the estimated cost of the defects, an expert has examined the portion of the edifice affected. It has been decided to proceed with the renovation shortly, which will cost between 300*l.* and 500*l.*

THE Willington Urban District Council have instructed their works committee to consider the question of a refuse destructor.

MR. COLE ALFRED ADAMS, F.R.I.B.A., of 66 Victoria Street, S.W., died on February 21, at the age of sixty-four, after three and a half months' suffering. Mr. Adams became an Associate of the Institute in 1874.

HEREFORD GARDEN CITY.—The committee of the Hereford Co-operative Housing, Ltd., on February 22 instructed Messrs. Groome & Bettington, architects, to accept the tender of Messrs. W. P. Lewis & Co., Hereford, for the building of twenty cottages on the site near Barrs Court station.

THE Safety Tread Syndicate, Ltd., 15 Barbican, E.C., announce that owing to the low price of metals they have been able to make contracts for long supplies of material at the favourable prices now ruling. There are therefore now substantial reductions on the list prices of Mason's Patent Steel and Lead Treads (V-grooved sections).

MR. P. C. COWAN, M.Inst.C.E., Chief Engineering Inspector of the Local Government Board, Ireland, held an inquiry at Belfast on Monday into an application by the Corporation for sanction to loans of 8,000*l.* and 75,000*l.*, for the purpose of enlarging the lunatic asylum at Purdysburn. It is proposed to proceed with the first instalment of the work directly official sanction for the loan is received.

A LOCAL Government Board inquiry was held on Tuesday at Fleetwood, Lancs., into the Council's application for authority to borrow 21,500*l.* for the purchase of the undertaking of the Fleetwood and District Electric Light and Power Syndicate. It was stated that the Council had obtained a provisional order to purchase the electric light works, and the amount agreed upon was 15,000*l.* Various other sums for stock, new refuse destructor, and the freehold of the works brought up the amount to 21,500*l.*

AT the last meeting of the executive committee of the Swansea Harbour Trust plans were submitted for two new warehouses at the King's Dock, one of 400 feet by 150 feet, to be furnished with transporters and electrically equipped, to be devoted to the Eastern trade, and the second, 400 feet long by 50 feet, to be devoted to cargo trade. Plans were also submitted for a substantial extension of the fish market in the South Dock; also for the widening of the existing market and provision for accommodation on the roof of empty boxes.

A SERIES of fire-resisting doors were under test at the British fire-prevention committee's testing-station on Wednesday, there being four doors under review—i.e. an "armoured" tin-clad door, an iron door and two composite doors. The tests were high-temperature tests, up to 1,800° Fahr., followed by the application of water from a steam fire-engine. A large number of public officials were present, including Sir Schomberg McDonnell, K.C.B. (H.M. Office of Works), and representatives of nearly all the Government Departments concerned. The testing operations were under the direction of two sub-committees, presided over by Mr. Ellis Marsland (district surveyor) and Mr. J. Herbert Dyer (vice-president National Fire Brigades Union). Official reports on the tests will be issued at an early date.

THE A. A. play, 1909, will be entitled "The Rise and Fall of Architecture," interspersed with music by Claude Kelly and bits of rather ancient chaff by the editors of the Purple Patch. This entirely new production will be presented by the Architectural Association Musical and Dramatic Society at the King's Theatre, Covent Garden, on the following evenings:—Ladies' night, March 24, 8.15 o'clock; members' night (smoker), March 26, 8.15 o'clock. Tickets are limited, and can be obtained by members on application to Mr. T. W. Watkins, 11 Old Queen Street, Westminster, S.W., or at the offices of the Architectural Association, 18 Tufton Street, Westminster, S.W.

THE National Provident Institution for Mutual Life Assurance hold their seventy-third annual meeting to-day, the 26th inst. In the financial year ending November 20 last, 1,879 proposals for assurance were received and considered, amounting to 783,483*l.*; of these 345 were not completed, or were declined by the Board, amounting to 157,015*l.*, leaving 1,534 proposals, for which policies were issued amounting to 626,468*l.*, new premiums annually payable on which amount to 30,270*l.* 19*s.* 5*d.*; single premiums

MAW & CO. will forward their Pattern Books, or Special Designs, with Estimates for every kind of Wall and Floor Tiling on application. Patterns can also be seen and particulars obtained at the Showrooms of their appointed Agents,

Messrs. W. B. SIMPSON & SONS, 97 & 99 St. Martin's Lane, W.C.

AGENTS IN CAPE TOWN:—Messrs. D. M. Murray & Co., 2, 4, 6, & 8 Greenmarket Square. Importing Agents. Stocks kept

Digitized by Google

were also received amounting to 12,272*l.* 5*s.* 10*d.* Of the above new assurances, 45,000*l.* was re-assured with other offices at annual premiums of 3,827*l.* 18*s.* 4*d.* Twenty-seven immediate annuity policies were issued, securing 1,311*l.* 19*s.* 6*d.* per annum, the purchase money received for which amounted to 17,546*l.* 17*s.* 8*d.*

AN extremely compact portable electric hoist for the use of builders and constructional engineers has been put upon the market under the name of "Oerlikon," as it is produced by the Maschinenfabrik Oerlikon, whose London offices are at Oswaldestre House, Norfolk Street, W.C. These standard hoists are supplied for charges up to 1,120 lb., and a lift speed of approximately 1 foot 8 inches per second. Hoist 82 feet. The motors are built to suit supply systems, either for direct current or single-phase, two-phase, or three-phase alternating current. The hoists are sold complete with starter and speed reversing switch, fuses and fuse wires, also a flexible insulated cable on a drum, fixed to the carriage, permitting the connecting up of the motor on to the supply system, in any position. The motor is connected to the hoist by means of a worm gear of the well-known Oerlikon high efficiency type. The hoisting and lowering is done by means of levers. When hoisting the brake opens before the motor starts, and when lowering, the brake closes first. The weight of a complete apparatus on an iron framing with wheels, to work with three-phase 6 b.h.p. motor, is 2,600 lb.

BUILDING AND BUILDERS.

DINORWIC quarries resumed working full time on Saturday. Owing to the depression in the slate trade only five days a week had been worked for many months.

PLANS have been adopted for the erection of a Wesleyan church in Longsight, Lancs., on land near the Longsight cricket ground. The total sum required for the undertaking is 1,700*l.*

THE Great Western Railway at their meeting last week sanctioned several expenditures, including 25,000*l.* on the improvements at St. David's Station, Exeter, which had been rendered absolutely necessary by the increased traffic at the station.

THE Deptford Borough Council are going to take steps for the purchase of a central library site at a cost of 5,000*l.*, the negotiations in regard to certain houses at the corner of Lewisham High Road and Amersham Park Road having fallen through.

THE North-Eastern Railway Company are beginning a comprehensive scheme for alterations and additions to the offices, waiting-rooms, and refreshment department at Ripon station. The contract for the carrying out of the work has recently been placed with Messrs. R. Blackett & Son, Darlington.

THE Liverpool city magistrates on Monday approved the report of the sub-committee appointed to consider the proposed alterations and re-building of the police courts at a cost of 35,000*l.* The most important alterations and additions refer to the first floor. The idea is that the existing licensing court should not be interfered with, but otherwise practically the whole structure is to be remodelled and largely added to by building on land to the west of the present boundary.

THE Town Planning Bill to be re-introduced in Parliament this Session will, if passed, confer certain powers on the municipality of Sheffield. The City Council at its January meeting agreed to the appointment of a committee composed of elected and co-opted members, to consider the question in relation to Sheffield, and, by authorising surveys, or in other ways, as they may deem expedient, to place the Corporation in a position to take advantage of the powers which will be conferred upon them, should the Housing and Town Planning Bill be passed into law. Bodies outside the City Council will be represented as follows:—Sheffield Society of Architects and Surveyors, Mr. Fred Fowler and Mr. E. M. Gibbs; Sheffield Master Builders' Association, Mr. J. Biggin and Mr. A. J. Forsdike; Sheffield and District Building Trades Federation, Mr. H. A. Stone.

THE annual meeting of the Glasgow and West of Scotland Master Plumbers' Association was held in the Building Trades' Exchange, Glasgow, last week. Ex-Bailie James Kilpatrick (president) occupied the chair. The directors' report stated that the total membership was 183, there being 117 members in Glasgow and district, and 66 provincial members. Although last year the directors were of opinion that the state of trade in Glasgow and district reasonably warranted a reduction in wages, the rate was, however, not altered. After several meetings with the operatives' associa-

THE "DRAWWELL" GRATE

WAS PLACED

First in the Final Tests

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjunction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public and private buildings.

N.B.—All Grates bear the Trade Mark and Name of "Drawwell" on firebrick to insure against imitation.

This Grate can only be supplied through Builders' Merchants, Ironmongers, &c., but Drawings and Particulars can be obtained from

J. & R. CORKER, Ltd.,

tion several alterations had been made on the working rules. The treasurer's statement showed that the funds of the association now amount to 1,153*l.* 15*s.* 3*d.*, the sum of 38*l.* having been added during the year. The following office-bearers were appointed:—President, George Munro; vice-president, W. Twaddle; hon. treasurer, W. Johnstone; secretary, J. Wylie, writer, 204 St. Vincent Street.

The Royal Sanitary Institute have arranged lectures and demonstrations on sanitary science as applied to buildings and public works. The demonstrations commenced on the 10th, and the lectures on the 19th inst. The lectures have been arranged to assist those desiring instruction in sanitary science as applied to buildings and public works, builders, and those engaged in allied trades, and anyone desirous of obtaining the certificate of the Institute in sanitary science as applied to buildings and public works. Inspections and demonstrations are arranged. The subjects will be given by well-known authorities, and will be illustrated with diagrams, drawings, models, and lantern slides. The museum of sanitary appliances and the library are open free to students attending the course. Arrangements are made by which students can obtain the loan of books for a small payment. The fee for course is 2*l.* 12*s.* 6*d.* Students and others desirous of attending the lectures are requested to send in their names at once to the Secretary of the Institute, Margaret Street, W. Among the lectures are "Calculations, Measurements, and Plans and Sections," "Building Materials," "Sanitary Building Construction," "Sanitary Appliances," "Details of Plumbers' Work," "House Drainage," and "Water Supply."

A meeting of the Glasgow University Geological Society was held at the University last week, when a paper on "Building stones, with special reference to their behaviour in the Glasgow atmosphere," was read by Mr. R. Boyle, B.Sc. The lecturer remarked that the primary test of a building stone consisted in the microscopic examination of a thin slice, and chemical analysis should only be used to elucidate the petrographical structure. A cementing material of silica is in his opinion the best for the Glasgow atmosphere, and one of carbonates the worst. The presence of alumina up to about 1½ per cent. is only deleterious when in the form of ordinary clay. The Permian red sandstones of the south of Scotland withstand the Glasgow atmosphere best. In them the cementing medium is mostly iron peroxide, to which the red colour is due. Actual crushing tests collected and plotted by the writer show that the strength of a sandstone as determined from cubical specimens should be reduced about 10 per cent. Standard test specimens should have a height equal to 1½ times the least width. Flat surfaces should be avoided in buildings as far as possible. Projecting ledges, cornices, and string courses should be given a top slope, and in the case of some stones should be initially coated with concrete, oil paint, or other preservative.

A NEW FIREPROOF FLOOR.

Messrs. Mark Fawcett & Co. on February 6 gave an exhibition test of their latest floor, which they call Monlithcrete. The peculiarity of this is that rolled steel joists with their top flanges smaller than the lower ones have rhomboidal pieces punched from the web, leaving tension bars pitched at an angle of 45° in opposite directions from the centre, and are then used as the reinforcement of cement concrete. In the floor under test the joists used were 6 inches deep, with flanges 2 inches wide at top and 3 inches wide at bottom, the joists after being punched weighing 7.3 lb. per foot run. These were placed at 18-inch centres to form a floor 16 feet span by 2 feet 6 inches wide, with concrete 7½ inches thick. Spirally twisted bars, ⅜ inch by ⅛ inch, are used to give additional tensile reinforcement to the concrete, and were arranged at right angles to the joists. The concrete was composed of broken brick four parts, sand one part, and Portland cement one part, and was five weeks old at the time of the test. The floor was loaded with ballast, and showed ⅜ inch deflection with a load of 3½ cwt. per foot super, ½ inch with 4 cwt., ⅝ inch with 5 cwt., ⅞ inch with 7.25 cwt., ¾ inch with 7.8 cwt., and ⅞ inch with 8.4 cwt. At this last deflection three hair cracks were just visible, one at the centre of bottom edge, the others about 18 inches on each side of the centre.

The floor having thus been loaded to the breaking-weight (16.8 tons) of two 6 inches by 3 inches by 3 inches by 12 lb. rolled steel British standard beams was allowed to stand until February 13, when the loading was continued to 25.2 tons, or 50 per cent. above the breaking-weight of two

6 inches by 3 inches by 3 inches by 12 lb. rolled steel British standard beams, and the new type floor still stood. The box containing the ballast was by that time 13 feet 9 inches high, and heaped up to its full capacity the distributed load was 14 cwt. per foot super, and the maximum deflection was 2¼ inches.

On Tuesday, February 16, holes were cut in the sides of the box, allowing the ballast to run out, and as this went on the floor lifted again, and the deflection on clearing all off was found to be 1⅜ inch.

The value of wall-holds for the rolled steel girders, return ends, and longer time for the concrete setting is not here taken into account.

The aim of the inventor, Mr. Mark Fawcett, has been to obtain monolithic construction not by using concrete reinforced by bars and loose or fixed stirrups, but by using what might be described as lattice girders from which the compression members have been removed; in other words, rolled steel girders with large rhomboidal-shaped openings in the webs and tension bars pitched at an angle of 45° to the right and left of the centre, leaving the webs solid at each end to resist shear, whilst the top flanges are reduced to two-thirds the sectional area of the bottom flanges.

The result is that the steel beams, reduced in weight 40 per cent. from the British standard, are capable of carrying at least 50 per cent. more load. The new floor has besides the advantage that an aggregate, as broken brick, can be used for the concrete, possessing greater resistance to fire and less conductive of sound than ballast concrete ordinarily employed in reinforced work.

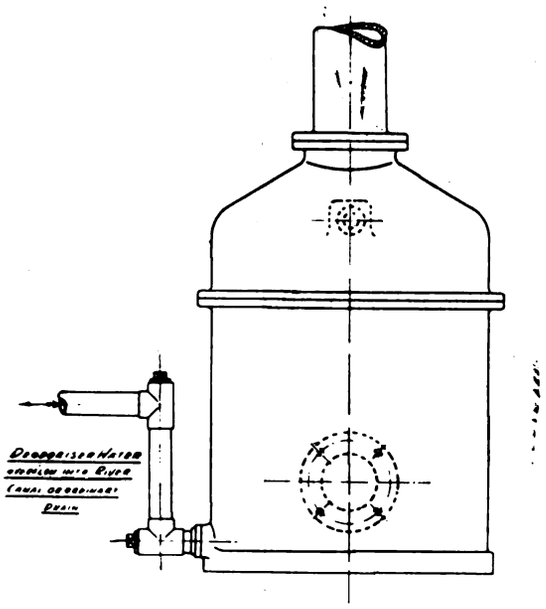
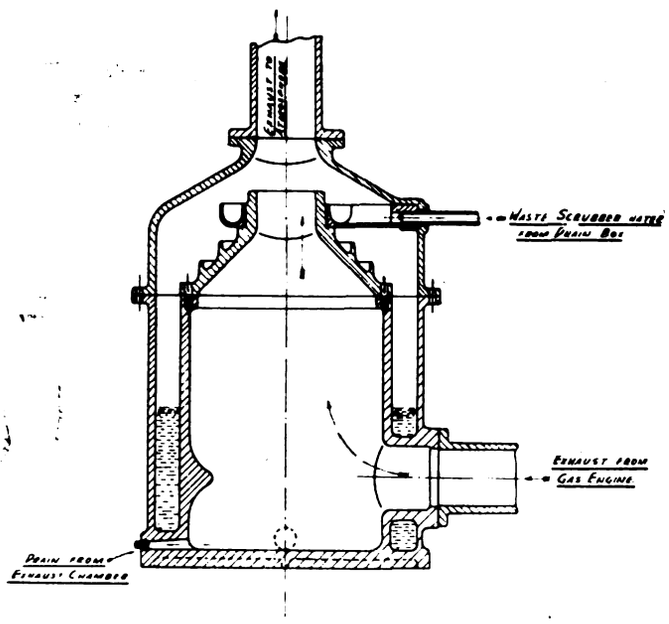
TANGYE'S
Gas Engine and
"Suction" Gas Producer.

The Most Economical and Reliable Motive Power.



Our Patent Deodoriser effectually disposes of the objectionable fumes from the scrubber water in confined situations.



Full Particulars on application to—
Tangyes Ltd., Birmingham.

Digitized by Google

TANGYES' PATENT DEODORISER.

Many users of "suction" gas-producers have come into conflict with the local authorities through the discharge of the scrubber water, with its offensive smell, into public sewers. In some cases the owner has been compelled to reconstruct his drains at considerable expense before the sanitary authorities will allow of the discharge of this waste water. Tangyes, Ltd., brought their long experience to bear upon this difficulty, with the result that they have produced the "deodoriser" illustrated. The waste scrubber water from the drainbox of the "suction" producer flows through a pipe to the deodoriser, where it trickles through small holes in a circular cup, and distributes itself over the top of the exhaust chamber, which is cast inside an outer casing. This inner chamber is heated by means of the exhaust gases from the gas engine, and thus the water becomes heated and liberates the objectionable smell; the fumes then pass up the exhaust pipe along with the exhaust gases to the atmosphere, the deodorised water passing to any river, canal or ordinary drain. The deodoriser is strikingly simple in construction, automatic in action, and once the moderate first cost is defrayed, no further expense is incurred, since no agent of any kind is needed. Its efficacy is indicated in a letter received from the head engineer at the Hotel-Hydro, Dunblane, Perthshire. In the course of it he thus speaks of the deodorisers which had been fitted to their suction gas-producers five months previously:—"They have given the greatest satisfaction; there is not the slightest smell about the establishment, and they have entirely relieved us of all our troubles with the townspeople."

PAINTING STRUCTURAL STEEL.*

(Continued from last week.)

Paint and the Painting of Steel.

At one time paint-making was an art, then it became a trick, now it is a science.

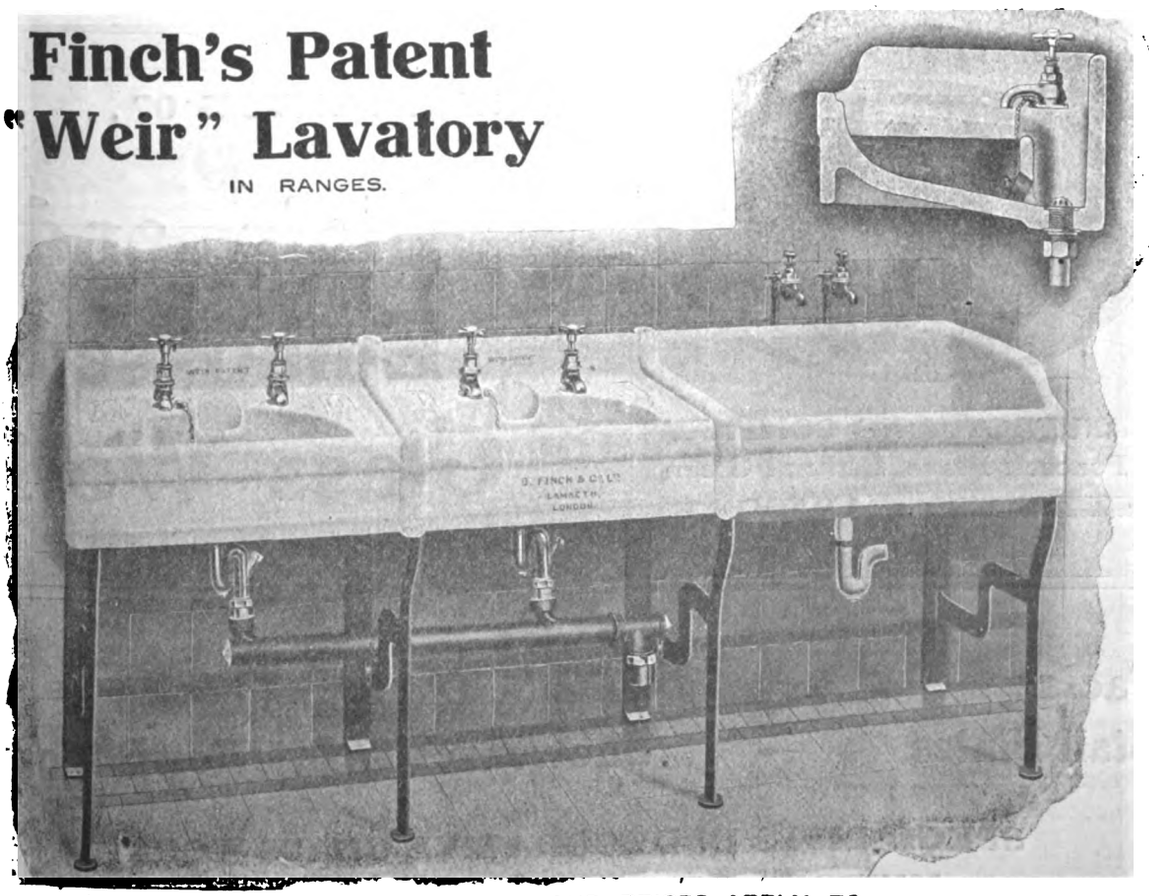
The theory that oil, or the binder, is the life of paint—that is to say, the thing that makes it wear—is to a certain extent misleading, and has been the cause of many of the blunders and failures with it in the past. An excess of linseed oil in paint is nearly as much an adulteration as the introduction of a useless or harmful pigment. We work upon the hypothesis that solids are co-efficient with the liquids in producing the best materials, and that the secret—if there be any—lies in the proper adjustment of the amount and kind of each needed to secure a perfect product. No amount of theoretical and empirical knowledge can determine questions of this kind. There are to-day many signs, however, that in the struggle for victory men are accepting the logical conclusion from classified facts—in their mutual relation and sequence—that properly prepared paint is bound to win, because it is based upon sound idealism.

In making paints of value the end aimed at is a close union of solids or pigment and liquids or binders. This is obtained mechanically or chemically, or by a combination of both. Ordinary mechanical mixtures, in which solids and liquids have little or no affinity for each other, or in which powders are feebly suspended in the liquids, scarcely deserve the name of paint.

A perfect paint for structural steel would be one in which the pigment and binder formed a close union, so that there could be no separation, no precipitation of the pigment; in other words, it should form and secure upon the surface of the metal an even covering of an adhesive, cohesive, elastic, harmless and durable cement, impervious to, and unaffected by, either moisture, heat, frost, or climatic changes. It should wear evenly and gradually, and not by disintegration, and should leave a good surface for repainting. It should also be fairly easy of application and dry fast enough.

* Abstract of a paper by Mr. Gaston Despierres, read before the Paint and Varnish Society, London, entitled "Paint and Its Application to Structural Steel."

How best to secure these essential features is a problem which will probably continue for years to come, until some means are devised under which it will be possible to determine quickly what coatings satisfy the requirements of service and use.



As a manufacturer of both oil and varnish paint, my faith is at the present moment established in varnish paints, because years of study and experience have demonstrated their superiority for steel to coating of any other kind—admitting, of course, that the paints are well made.

Andes, in his work on anti-corrosive paints, in discussing the number of coats of paints that must be applied to iron in order to secure efficient protection against rusting, says that in establishing a standard, preference must undoubtedly be accorded to paints requiring a large portion of oil varnish to make them work properly. He says:—"It may be laid down as a moral standard that, pre-supposing the use of a good paint, one bottoming or priming coat, and three subsequent coatings laid on at suitable intervals, will be required to produce a layer of sufficient thickness on iron to keep moisture away from the metal, and to protect the latter from rust for a certain time." Most men having a practical knowledge of the subject will agree with this.

The first, or priming coat, upon a surface of steel in a fit condition to receive paint is of the greatest importance, in view of the circumstances that the union of the paint and the substratum depends entirely upon the adhesion of this coating, and the first problem to be solved in the painting of steel is necessarily, not which paint sticks best on another coat of paint, but which paint adheres most firmly to iron.

For a long period red lead alone was employed for this purpose, and even now still enjoys a reputation not altogether undeserved, and, when in competent hands, has given very fair results. However, personally, I do not admit that red lead is the best and ideal pigment for priming. After many experiments spread over years, I have come to the conclusion that the most perfect priming coat is obtained by the use of orange lead, a pigment of lower specific gravity—6.85—and of finer texture, which, when mixed in certain proportions with an inert pigment having a great oil-absorption, produces a paint which can be properly ground and mixed for use having, by reason of its fineness, great adhesive power, and capable, owing to the presence of the inert pig-

Digitized by Google

ment, of lessening the oxidising action going on between the oil and the lead oxide, thus shortening the life of the linoxyn formed.

The difference between each coat should be gradual, so as to form a layer which, starting upwards, becomes more elastic as it approaches the finishing coat.

As to the character of the pigment that should be used with the linseed oil varnish for making paint for use as top coats, it is quite important that the pigment used shall be pratically both chemically and physically inert; more important still, that it shall be in a fine state of division, and form a perfectly homogeneous product which can only be obtained by repeated grinding.

One of the principal functions of the solids in paint is to protect the dried binder from destructive influences. Some substances, by reason of their stable nature, possess this property in a high degree—they do not act chemically upon the oil, and are not easily changed. They are classed as inert pigments, and should be used simply as a means of improving and increasing the durability of the paint.

Regardless of colour, there is no one pigment that will "answer all requirements, fill all the offices," of a perfect pigment to mix with the linseed oil varnish for paint making, not a single one that will do what pigments must do, until an ideal binder is found to mix with it, that will retain it and prolong the life of the paint. Certain solids, under certain conditions and in certain proportions, have mutual action upon each other; they interchange elements and combine to form new substances, just as metals alloy and form new metals.

Now, applying this truth to pigments:—

In order that chemical combinations may follow, or that which is bad in one pigment may be linked with that which is bad in another to produce a new pigment that is good, it is necessary that the solids under consideration be very finely divided, very closely intermingled; and that the affinity between them be great enough to excite the desired interchanges, and to form the new substance.

It is upon this sound theory that most combination paints are unwittingly made; if such paints are scientifically and honestly manufactured, they are worthy of the utmost confidence. Given these features, whether the pigment is oxide of iron graphite, or "what not," is a matter of little importance as far as durability is concerned. The value of the paint will lie in the proper adjustment or determination of the amount and kind of each—that is, liquid and binder—needed to secure a perfect product.

Various theories are expounded by various authors; but, not wishing to add a fresh one, I will only say that my experiments have convinced me that pure white lead is not a good protective coating for iron.

It is possible to-day to get paint uniformly well prepared for almost any purpose. A painter or paint user of the present time who attempts to mix and grind his own paints is as unlikely to succeed as if he were to attempt to make his own varnish, brushes, &c. It is not my purpose to discuss methods of applying coverings to structural steel other than to insist that a mechanic to do good work must have good tools to work with, and fair conditions under which to do the work set before him. Many worthy paints are ruined because they are flowed on with a broad, thin, flat brush, not much better than a common whitewash brush, instead of being rubbed out and well into the surface with a good full, round bristle brush. Then again, painters are apt—if the paint used is a little heavy or the parts to be covered difficult of access—to add an excess of thinners to save labour and reduce cost of material.

It is known that the durability of any oil paint depends largely upon the number of particles of pigment, the better protection to the binder and to the metal underneath—the evil of thinning paints too much is therefore obvious. A layer of air exists on all surfaces, hence the importance of rubbing out the paint thoroughly, as otherwise bubbles of air may be discovered, which, coming through the paint, render the coating porous.

The spraying of paint upon structural steel by means of air compressors conveys air and moisture to the metal, and helps the formation of rust; besides, its many disadvantages have led to its abandonment by nearly everyone who has tried it.

(To be concluded.)

THE governing body of the Royal Portsmouth Hospital are considering plans for the erection of a nurses' home, at a cost of 12,000*l.*

Art Plates from "The Architect."

AWARDED GOLD MEDALS, INTERNATIONAL HEALTH EXHIBITION AND ARCHITECTURAL AND BUILDING TRADES EXHIBITION (1889).

PROOFS on PLATE PAPER of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form on proof paper suitable for framing.

***The Corn Field.*—(1) Ploughing; (2) Harrowing; (3) Mowing; (4) Carting; (5) The Products of the Corn Field.**

In Five Separate Plates. Total Length, 14 ft. 7 in. by 15 in. deep. A splendid example of Colour Work in Permanent Ink Photo. By M. PAUL ALBERT BAUDOIN. This magnificent Illustration was presented to the Subscribers to "THE ARCHITECT," in 1886. A few proofs were taken which immediately became out of print.

OPINIONS OF THE PRESS.—"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition has been issued."—*The Lady's Pictorial.* "They are beautifully done in colours by the permanent ink-photo process and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—*The Stage.* "The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour work in permanent ink photo by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic and would grace the walls of any house."—*The Gentlewoman.*

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates they have been reproduced by Subscription at Half a Guinea the Set, free by post, carefully packed inside patent roller, and are now ready for issuing. Immediate application is requested. May be had framed in Black Reeded Frame with Gold Mounts, price Three Guineas the Set of Five Pieces.

OXFORD

THE late Matthew Arnold never tired of referring to Oxford, his *alma mater*. "Beautiful city!" he exclaimed, "So venerable, so lovely, so unravaged by the fierce intellectual life of our century, so serene! And yet steeped in sentiment as she lies, spreading her gardens to the moonlight, and whispering from her towers the lost enchantments of the Middle Ages, who will deny that Oxford, by her ineffable charm, keeps ever calling us nearer to the true goal of all of us, to the ideal, to perfection—to beauty, in a word, which is only truth seen from another side."

The following illustrations, which were published on the dates mentioned, can be purchased at 4*d*. each from Messrs. Gilbert Wood & Co., Ltd., Imperial Buildings, Ludgate Circus, E.C.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

TRADE NOTES.

THE new schools, Gravesend, are being supplied with Shorland's patent Manchester grates by Messrs. E. H. Shorland & Bro., of Manchester.

UNDER the direction of Mr. Brian E. F. Sheehy, architect, Limerick, the "Boyle" system of natural ventilation, embracing the latest patent air-pump ventilators, has been applied to boys' school, Kilfman.

MESSRS. C. W. LEAVITT & Co., importers and selling agents of ores, metals and alloys, New York, announce that on and after March 20 next their offices will be located in the Hudson Terminal (Cortlandt Building), 30 Church Street, New York.

THE tender of Mr. G. Percy Trentham, Handsworth, Birmingham, amounting to about 3,000*l*., has been accepted for kerbing, paving and roadwork in twenty-five streets by the Yardley Rural Council.

MESSRS. C. H. HUNT & SON, High Wycombe, are the contractors for the new railway station at Abingdon, and the work will be put in hand about the middle of March. Enlarged premises will be erected over the present site.

THE Carlton Engineering Company, of 69 Leadenhall Street, E.C., have secured the order for one of their patent "Carlton" revolving sprinklers, 55 feet diameter, to be fitted with their patent self-cleaning and self-dosing arrangement, and erected at the new sewage works at Ferryhill.

BUILDING AND BUILDERS.

THE Walton school managers, Surrey, have agreed to carry out alterations to the Walton schools at a cost of 1,690*l*., to erect a special subjects two-storey building to cost 800*l*., and to improve the infants' school at a cost of 465*l*.

THE York City Council referred back on Monday a recommendation by the streets committee to make a new road from Leeman Road to Waterworks Lane, at a cost of nearly 5,000*l*. It is hoped to come to arrangements with owners to secure not only enough land to make the road, but also adjacent building sites.

THE Birmingham education committee have adopted plans for the proposed Council school in Sladefield Road, Saltley. The school was planned in two blocks, with accommodation for 1,000 children, but it is proposed at present to provide only for 650. The cost of the school for 1,000 children would be 16,000*l.*, but the building to be erected will cost 11,229*l.*

THERE was an interesting discussion at the Liverpool health committee last week, as to the importation of Scandinavian granite. It arose out of an application of a Liverpool firm, acting as agents for principals in Norway, to be placed on the list of contractors for the supply of granite. In view of the fact that the applicants were agents for a Norwegian firm, their request was marked "Declined," after a short debate.

THE War Office has decided to carry out some important works at Woolwich. New married quarters for troops will be erected at a cost of 13,000*l.*, and a new mess and quarters will be built for officers of the Royal Army Medical Corps, at a cost of between 11,000*l.* and 12,000*l.*, at Woolwich Dockyard. The saddlery inspection shed, pattern room, and offices will be rebuilt, at an estimated cost of 16,000*l.*, and the east pumping station will be improved at a cost of nearly 7,000*l.*

A STRIKE of painters in St. Helens, Lancs., seems imminent. The masters wish their employés to commence work an hour or an hour and a half later in the morning, giving as the reason that it is inconvenient to customers that workmen should enter their premises or dwellings so early as six o'clock. The men regard this as a move to do away with the breakfast half-hour, and, moreover, they do not look with favour upon the possibility of working until a later hour in the evening. Their society has had the masters' proposals under consideration, and has, it is understood by the *Liverpool Courier*, declined to agree to them. If the masters enforce their requirements the men will tender their notices.

WE complete in this supplement an abstract of a paper on "Painting Structural Steel," which was recently read before the Paint and Varnish Society by Mr. Gaston Despierres. This society was formed towards the end of last year "for the discussion of all matters of technical interest, and the advancement of scientific knowledge amongst all concerned in the manufacture or application of oils, colours, varnishes, and similar products, or with the arts and crafts connected with such materials." Monthly meetings are held at St. Bride's Institute, Fleet Street, E.C. The president is Mr. J. Cruickshank Smith, and the hon. secretary is Mr. Noel Heaton, B.Sc.

THE Builders Clerks' Benevolent Institution held last week their forty-second annual meeting at the offices, 21 New Bridge Street, the president, Mr. E. C. Hannen (of Messrs. Holland & Hannen), occupying the chair. The annual report stated that the income represented a total of 965*l.* 1*s.* 9*d.*, including annual subscriptions, 213*l.* 3*s.*; donations, 559*l.* 2*s.* 6*d.*; and dividends on investments, 172*l.* 10*s.* Of that sum 707*l.* had been expended on pensions for 29 widows and two aged clerks, while 39*l.* had been granted in temporary relief. Mr. Leonard Horner (Messrs. Ashby & Horner) has been elected president for the ensuing year.

THE Surrey education committee at their last meeting adopted the report of their building sub-committee. A classroom is to be added at Monument Hill school, Woking, at once, and the infants' school at Church Street, Woking, is to be enlarged by 100 places. The plans of the proposed additions to the Goldsworth Road school, Woking (costing 1,720*l.*), have been approved. A temporary infants' school is to be erected at Horsell on a part of the voluntary school premises at a cost not exceeding 375*l.* The tender of Messrs. Hawkins & Co., of Westminster, for 3,941*l.* 17*s.*, has been accepted for the erection of the New Malden infants' school; and that of Messrs. Darvill, of Watford, amounting to 2,400*l.*, for the erection of the Walton-on-the-Hill infants' school.

A CASE to test the liability of employers for the loss of their workmen's tools was brought recently in the Manchester County Court by a carpenter and joiner, of Gorton, with the support of the General Union of Carpenters and Joiners. He claimed 1*l.* 11*s.* 11*d.* from Messrs. Davenport, Sons & Co., contractors, of Platt's Park, Manchester. Evidence stated that the plaintiff's tools were removed from a lock-up shed to an open motor-shed, and that while there some were taken away. Judge Parry after plaintiff and his counsel had given evidence, said he did not think it necessary to call any other witnesses. The case was an important one to the workmen. The rules, in addition to providing that the employers should furnish a place of safety for the tools, provided that the men should be at the place at the proper time for starting work. Although it might not be a contract by which an employer could be bound, still a custom acted upon by masters and men would be regarded as a reasonable one. In any case, here it was acted upon to such an extent that there was a lock-up shed, and as the plaintiff's tools were removed from that shed he was entitled to the right of action. There would be judgment for the plaintiff for the amount claimed ; and as no money had been paid into court, and it was an important case in which counsel might have been called upon to argue a point, the costs would be on the highest scale, with certificate for counsel.

VARIETIES.

THERE were about 400 applicants for the post of foreman at the Cardiff Mental Hospital, at a salary of 110*l.* a year with house, coal and light.

NORTH DUBLIN workhouse and four dispensaries are to be lighted by electricity instead of gas as at present. The estimated cost per annum is 523*l.*

THE Preston Town Council have decided by twenty-seven votes to thirteen not to proceed with the scheme for the erection of new baths, for which borrowing powers had been obtained.

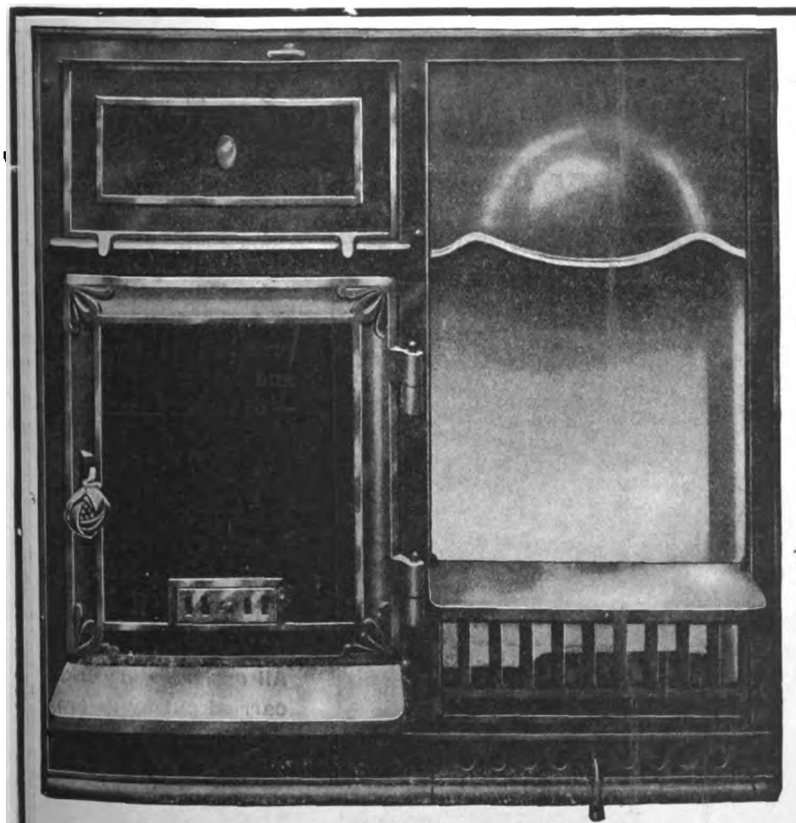
THE new school about to be erected at Luton, Kent, will accommodate 500 boys and a similar number of girls. It is hoped also that a boys' secondary school will be erected at Gillingham, and a girls' school at Chatham.

A HEAD post-office will shortly be erected in Bank Road, Matlock, at a probable cost of about 15,000*l.* The new building is to be completed by 1910.

THE Great Eastern Railway Company have given orders for the whole of their steamers on the Harwich-Antwerp service to be fitted with the same system of wireless telegraphy as installed on their Hook of Holland steamers.

THE new central offices for the Admiral-Superintendent and the heads of departments of Devonport Dockyard and their staffs are to cost 16,000*l.* The buildings, which are shortly to be commenced, will take two years to complete.

ST. MARK'S CHURCH, Sheffield, is to be enlarged by the erection of vestries for clergy and choir in the south-east corner of the church according to plans prepared by Mr. J. D. Webster, architect, Sheffield.



THE Dundee free library committee have approved of plans prepared by the city architect for the erection of central reading rooms at the corner of Ward Road and Barrack Street at a cost of 11,000*l.*

AT the monthly meeting of the Eastleigh and Bishopstoke Urban District Council it was reported that the sanitary committee had approved plans for sixty-four houses in Chamberlayne Road, seven at Newtown, and one at Bishopstoke.

THE Spennymoor Urban Council have agreed, after a discussion extending over seven years, that application be made to the Local Government Board for sanction to borrow 25,000*l.* for the purpose of carrying out the proposed sewerage and sewage-disposal scheme as submitted by Mr. C. F. Murphy (Morpeth) for the whole of the urban district.

MR. F. H. TULLOCH, C.E., held a Local Government Board inquiry at Todmorden on Friday last concerning the application of the borough of Todmorden to borrow 26,471*l.* for paving Burnley Road, Halifax Road, Rochdale Road, and Water Street, and 3,645*l.* for works of street improvements on Stansfield Hall estate.

THE Governors of the West End Hospital, London, are considering plans for the reconstruction of the hospital. A site has been obtained contiguous to the present building in Bulstrode Street. A travelling committee recently visited the principal European hospitals for the treatment of nervous diseases for the purpose of obtaining the best possible scheme.

"SIGNET"
(No. 2)
Combined
Range & Register

Very suitable for Small Houses, Country Cottages, Flats, &c., where the same apartment is used as Kitchen and Sitting Room.

Combines in itself in a **practical** and **efficient** manner the essential features of a Cooking Range and a Sitting Room Grate.

Fitted with Patent Adjustable Damper, giving effectual control of chimney draught and economy of fuel—**an important feature.**

GOES INTO AN ORDINARY SITTING ROOM FIREPLACE.

Supplied in a variety of forms.

Large numbers in use throughout England and Wales, in Garden Cities and elsewhere, and giving universal satisfaction. Numerous unsolicited and enthusiastic testimonials received, copies of which, with full details of the grate, will be forwarded on application.

The Grate itself can only be supplied through Builders' Merchants, Ironmongers, &c.

WE GUARANTEE SATISFACTION.

THE Great Central Railway Company has posted notices in its locomotive and carriage and waggon department that from this week full time will be reverted to instead of four and three-quarter days per week, which has been the rule during the past seven months.

MIDDLESEX County Council has agreed to obtain the advice of an expert respecting a proposal to demolish the Guildhall, Westminster, and to erect a new structure on the same site and the adjoining ground belonging to the Council.

PLANS for the reconstruction of the Theatre Royal, Hull, have been submitted to the works committee of the Hull Corporation by the Sefton-Parry Syndicate, Ltd., but they have been returned for amendment. The theatre was recently closed for structural reasons.

THE Brass Masters' Association of Birmingham at their annual meeting adopted the following resolution:—"That this meeting of master brassfounders regrets that the School of Art and Technical School are under different committees, and considers that there will be no satisfactory technical and artistic training in Birmingham until both schools are under the same management."

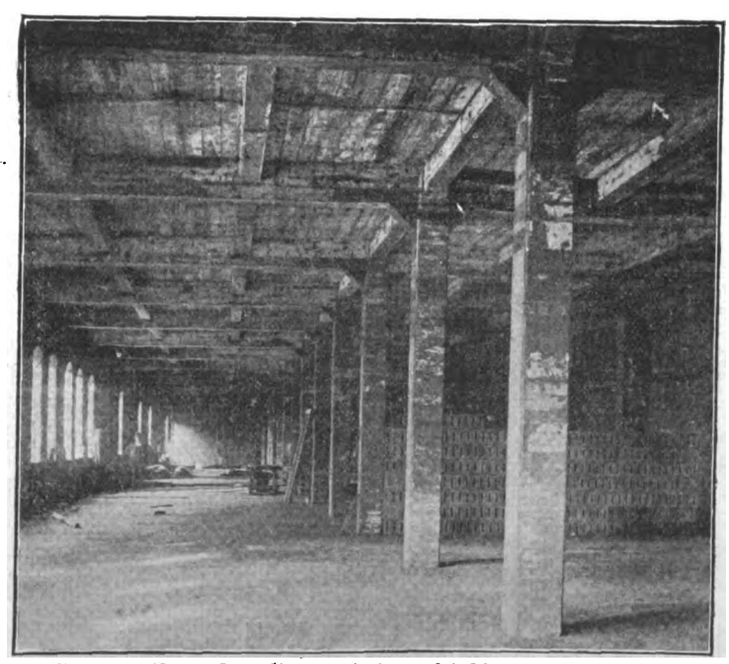
THE executive committee of the Blantyre Cottage Hospital, N.B., decided last week to proceed with the erection of a cottage hospital. The plans of Messrs. Hutton & Taylor, architects, Glasgow, have been accepted. The building is of the pavilion type, comprising male and female wards, operating theatre, and the usual administrative accommodation for a cottage hospital.

THE education committee of the Birmingham Corporation have been authorised to acquire the Greyhound public-house, at the corner of Navigation Street and Summer Street, and Nos. 28 to 34 Navigation Street, containing together about 1,058 square yards, at a total estimated cost of 7,000*l*., for the purpose of extending the Municipal Technical School. The committee were also instructed to negotiate for the purchase of Nos. 35 and 36 Navigation Street, and 59 to 62 Suffolk Street, containing an area of 714 square yards.

WITH the object of encouraging original research in sanitary science the Grocers' Company have determined to offer two scholarships, each of 300*l*. a year, with an allowance to meet the cost of apparatus and other expenses in connection with the work, tenable for one year, but renewable for a second or third year, subject to the conditions of the scheme under which they are established. The next election will take place in May. Applications must be sent in before April 1 to the clerk of the Grocers' Company, Grocers' Hall, London, E.C.

THE Treasury have issued a return of all contracts made in the United Kingdom for manufactured articles by the Government Departments in the year ended March 31, 1908, either with contractors outside the United Kingdom or with contractors or agents who obtained the articles from abroad. This shows that the various departments spent a total of 408,577*l*. 3*s*. 3*d*. The return includes the Office of Works (England), who sent 25,622*l*. abroad, 10,812*l*. being for marble work, 8,240*l*. for wood-block flooring, and 5,102*l*. for mosaic. On the extermination of rats 31*l*. was spent in Danysz virus. In the Irish department only 42*l*. 5*s*. 6*d*. went abroad, 7*l*. 5*s*. 6*d*. of this being for Austrian bentwood chairs.

OWING to the death of Lord Nunburnholme, the executors have placed on the market the family mansion, No. 41 Grosvenor Square, which was designed by the late George Devey. It was specially erected about 1883 to suit the late peer's requirements with a view to entertaining on an extensive scale. The elevation is of bold design carried out in red brick and Portland stone. It has many notable features, such as the great marble hall and staircase, the Louis Quinze ball-room which is 88 feet long and has a minstrels' gallery, the Georgian dining and drawing-rooms adorned with carvings after the manner of Grinling Gibbons, and the boudoir, which has some rare Spanish steel work of the sixteenth century as cupboard fittings. Unless a private sale takes place the house will come under the hammer of Messrs. Knight, Frank & Rutley on March 26.



THE medical officer to the Bideford Rural Council in his annual report states there is no redundancy of cottages in the neighbourhood, and consequently the inability to find accommodation for the evicted renders it impracticable to deal with any but the most glaring cases. A boon to the district would be the erection of modern houses within the means of those earning from 12*s*. to 14*s*. a week. Therein was propounded a knotty problem, and the case was emphasised there by the absence of railway accommodation, and the

necessity of conveying building materials vast distances by road.

THE work of rebuilding the spire on the north tower of Ottery St. Mary parish church has now been completed, and the old weathercock has again been put on the summit. The rebuilding of the spire has been carried out according to designs prepared by Mr. J. D. Coleridge, the honorary architect. The framework is of British steel, and is covered with lead on an under covering of felt on wood battens The old framework, most of which has been in existence for many centuries, was of oak, which had badly decayed, and had long been in a dangerous condition. The weathercock, which was originally constructed to whistle in a strong wind, but which has been silent for many years, has been restored to its original condition.

THE directors of the Worthing Pier Company advocate the enlargement and improvement of the pier. They have definitely adopted plans which, with respect to the superstructure, have been prepared and designed by Mr. S. D. Adshead, of 45 Great Russell Street, London, in co-operation with Messrs. James Mansergh & Sons, the engineers for the substructure and steel and girder work. The scheme provides for the erection of an arcade of ten shops and a pavilion, which is approached through a vestibule, and has seating accommodation for 540 people on the ground floor and 160 people in the gallery. To provide for skating, the floor of the pavilion and vestibule will be maple. The estimated cost is 8,500*l*.

RETURNS have been tabulated from eighty-three American cities as to the expenditure on building operations. For these American cities the aggregate for January was $47,829,108, as compared with $23,935,222 in the month of January last year. This is a decrease of 3 per cent. on December, but an increase of about 99 per cent. on the corresponding month of last year, when the depression was so extreme. Building operations therefore are now about double what they were a year ago. Of the eighty-three cities reported on, only nineteen show decreased expenditure on building, and thirty show expenditure more than double a year ago.

A JOINT deputation from Glasgow recently paid a visit to various markets and slaughter-houses on the Continent. Their object was to obtain information to assist the markets committee in carrying out the proposed extension of the slaughter-houses at Moore Street. On the subject of material for construction the deputation report that in view of the high price paid by the Corporation for the ground acquired for the extension of the slaughter-houses and the limited area at their disposal, and having seen many excellent examples of reinforced concrete used in the construction of slaughter-houses on the Continent, that class of material be used in the construction of the new slaughter-houses, as they are advised that while it would be as endurable as brick it would be cheaper and economise space to the extent of about 450 square yards.

AT a special meeting of the Wellington Rural District Council, Mr. Raikes, engineer, Wolverhampton, submitted plans of a scheme for the disposal of the sewage of the village of Admaston, with an estimate of the cost, and it was resolved to apply to the Local Government Board for sanction for a loan of 2,700*l*. to carry out the work. Mr. Raikes also submitted plans of a similar scheme for Hadley, and it was decided to apply to the Local Government Board for a loan of 700*l*.

DIFFICULTIES have arisen in connection with the proposal by Dumfermline Town Council to lay a new main sewer from the town through the Admiralty's and Lord Elgin's land down to a point in the Firth of Forth. The Government have stated that on no account will they allow unfiltered sewage to be discharged into the Forth. If the Council wish to provide sewage facilities at Rosyth, they will have not only to lay a sewer pipe to the Forth at the estimated cost of 26,000*l*., but also erect sewage purification works near the shore, bringing the total cost of the undertaking up to 50,000*l*.

THE district auditor, Mr. F. B. Cockerton, has prepared a report on the accounts of the London County Council, 1907-8. With regard to the Norbury brickfield, the auditor points out that the average price per 1,000 bricks at March 31, 1907, exceeds the expert valuation made twelve months later by 11*s*. 1*d*., and that the cost price as shown on March 31 last exceeds the price which the Council would have had to pay to a building contractor by 8*s*. 1*d*., and the price as shown by the expert valuation by 19*s*. 2*d*. per 1,000. In his opinion

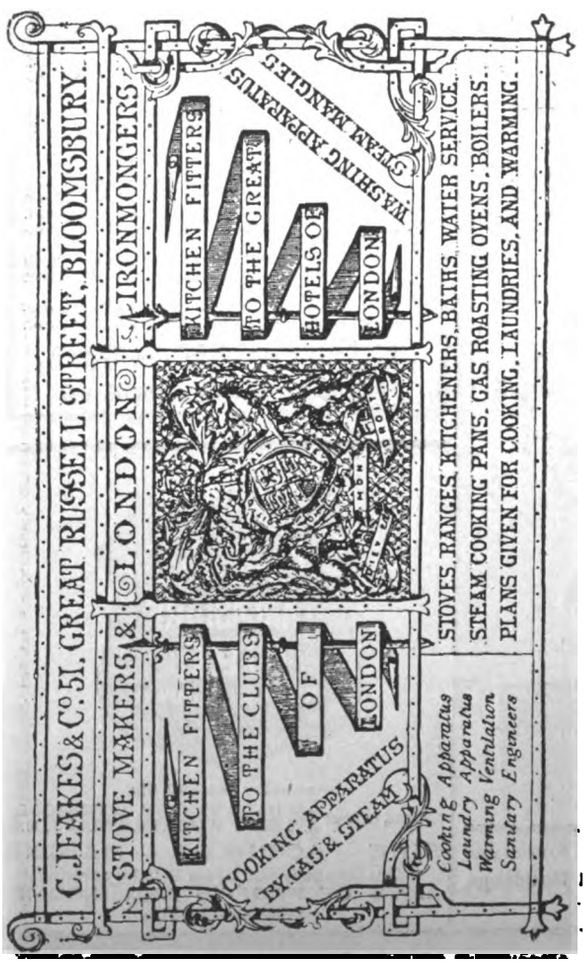
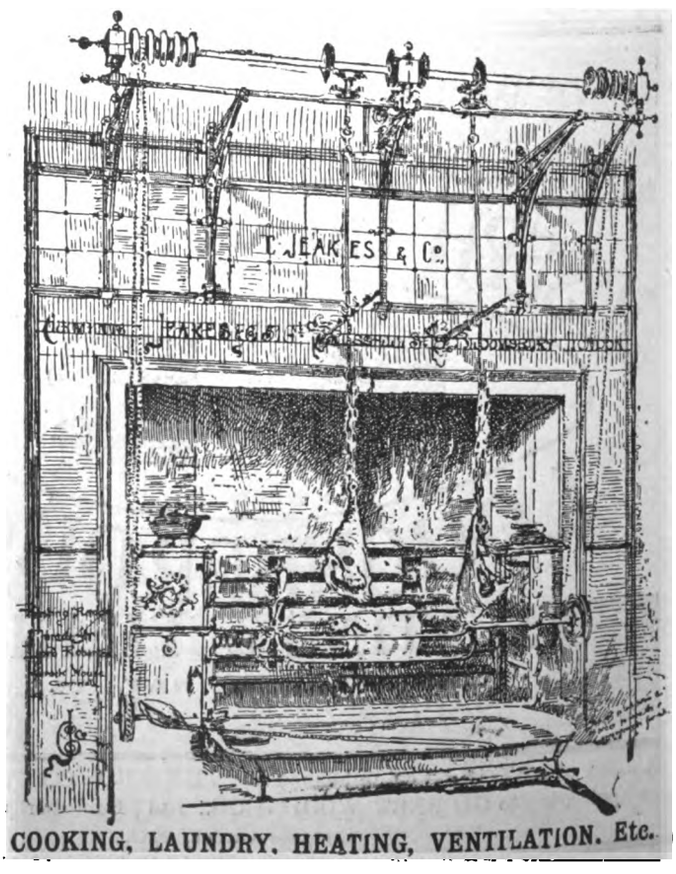
these figures show conclusively that the valuation of the bricks should always be made upon some uniform basis. The aggregate deficiency to March 31, 1908, on the brickfield account was 6,342*l.*, of which amount 2,868*l.* represents the deficiency in respect of the year under review. He adds that this would have been increased by 1,744*l.* if the whole of the bricks in stock on March 31 last had been valued at the average price stated by the expert valuer. The reason given for valuing a portion of the stock at cost price was that certain bricks had been reserved for building purposes. As, however, all the bricks were produced for building purposes, the auditor cannot agree that it is a sound principle to separate any portion of the stock and use a different valuation. When the bricks are actually used their cost price will be charged as part of the cost of the building.



THE apprentices' prize competition inaugurated by the Yorkshire Master Painters' Federation attains its majority this year, and the anniversary is being kept in York. There were two classes, the first being for apprentices over eighteen years and under twenty-one years of age, and the second for those under eighteen, the prizes given being for sign writing, various kinds of graining, tinting, marbling, plain painting, and decoration, designed and stencilled frieze in oil. E. Dean, of Bradford, as being the most successful competitor in the first class was given a handsome gold medal by the president (Mr. J. W. Bellerby), Mr. A. J. Dodsworth (vice-president) giving a silver medal of artistic design to C. E. Wood, of Hull, who gained the most awards in the second class.

MESSRS. IVOR JONES & P. E. THOMAS, architects, Cardiff, have been given first place in a competition for Y.M.C.A. premises at Merthyr. Sixty-one drawings were adjudicated upon by Mr. Gerald C. Horsley. On the ground floor there will be two shops and a café, the entrance stairway being placed between the café and the shops. On the first floor there will be a large reception hall, secretary's offices, billiard-room, bagatelle-room, smoking-room, conversation room, committee rooms, and two rooms for ladies. On the floor above there will be accommodation for juniors, including games rooms, also bathing accommodation, with slipper and shower baths. Above these rooms there will be a rifle range. At the rear, with an entrance from Park Terrace, there will be a hall, accommodating 700, which can be used as a gymnasium. The building will be carried out in brick and buff terra-cotta.



THE sub-committee appointed by Glasgow Corporation in connection with the proposed smallpox hospital at Robroyston have instructed the town clerk to write for information in regard to buildings for and other matters connected with smallpox administrative treatment to the Metropolitan Asylums Board, the Port Local Authority of London and the municipalities of Liverpool, Manchester, Birmingham, Leeds, Sheffield, Nottingham, Edinburgh, Aberdeen, Berlin, Vienna, Buda-Pesth, Copenhagen, New York, Chicago, Buenos Ayres, Ottawa, Quebec, Montreal and Toronto. The medical officer of health and the city engineer are to prepare a report on the history of hospital accommodation for the treatment of smallpox in Glasgow.

THE inquiry into the claim by the Manchester Corporation against the New Moss Colliery, Ltd., for 81,448*l.*, for damages to their Audenshaw reservoirs, caused by the colliery company's mining operations, before Mr. Pollock in the Official Referee's Court, London, after continuing for some days, was settled by mutual arrangement. It was agreed that the defendants should pay 17,500*l.* in three instalments—one on August 1, the second on February 1, 1910, and the third on August 1, 1910—each instalment if not paid at once to carry interest at 2½ per cent., and any instalment being in arrear for more than a month the Corporation to claim for the immediate payment of the whole sum. The costs of the inquiry are to be paid by the defendants as part of the costs of the action.

THE Torquay Tramways Company have received the conditional consent of the Town Council for the extension of their tram lines from the present terminus in Torbay Road to the borough boundary towards Paignton, in connection with the proposed extension to that town. Splendid road improvements will be made by the tramway company, including the widening of the main road to about 36 feet in several places, towards the cost of which the Torquay Corporation will make a contribution. The Board of Trade not being favourable to the surface-contact system of tramways, which is carried out in Torquay, the overhead trolley system is to be adopted in the extension to Paignton, and the Torquay Corporation will supply from their electricity works the power to run the trams so far as the borough boundary.

KINLOCHLEVEN WATER POWER WORKS.

ON Saturday last the first furnaces in the extensive aluminium works at Kinlochleven, N.B., were lighted. This marks the practical completion of the great water power and electric works which have been in course of construction at Kinlochleven during the last five years. The works have been the joint enterprise of the Lochleven Water Power and Electric Company and the British Aluminium Company, and comprised the construction of an enormous concrete dam—said to be the largest in Europe—at a point 1,068 feet above mean sea level, on a site 5½ miles from the head of Loch Leven, and its construction has absorbed the chain of lochs in the Blackwater into the reservoir lake, which has an area of nine square miles and a capacity of 20,000 million gallons. The native granite, which has been excavated to a depth of 5 feet over the whole site, has provided an excellent foundation for the work of building the dam, which has a width at base of 63 feet, gradually diminishing to 10 feet at cope level. The height of the dam varies in order to provide for the escape of flood water, the maximum being 86 feet, and regulation of the reservoir contents is achieved through a valve tower. From the reservoir the water passes through an upper penstock chamber into a covered conduit built in reinforced concrete, having a length of 3½ miles. Provision has been made against any possible shortage in the main water supply by connecting the conduit with three streams below the level of the dam. The internal dimensions of the conduit are 8 feet square, and the rate of flow of water through it is about 8 feet per second.

At the lower end of the conduit the water passes through a second penstock chamber which has been located on an eminence about 1,000 feet above the factories, the water being carried thence to the turbines by a six track pipe-line 2,000 feet in length. The pipes, which vary in thickness with the pressure from 11 millimetres to 22 millimetres, have an internal diameter of 39 inches, and are of welded steel, constructed in lengths of 20 feet. They were laid in 20 feet lengths, on concrete pedestals, anchorages being provided at each fall in gradient. The working head of water is 890 feet, and the power-house plant includes nine Escher Wyss turbines of 3,200 b.h.p. and two of 830 b.h.p., the large turbines running at 300 revolutions per minute. Messrs. Dick, Kerr & Co. have supplied eighteen 1,100 k.w. direct current shunt-wound generators working at 250 volts, which are coupled in pairs in parallel to the large turbines. Two other machines have been installed for lighting and traction. A small-gauge railway electrically operated serves the power-house and different parts of the factory. In addition to the main factory a small carbon factory has been erected to meet the needs of aluminium manufacture, and employment will be found for some 1,500 workmen, for whose accommodation one village has already been built, while a second is to be put in hand. Pending the opening of the main factory, work has been carried on in a small temporary works served by an independent water-power plant. The undertaking has been carried through in the face of enormous difficulties. Before any headway could be made Loch Leven had to be widened and dredged at Caolis-nan-con, to allow of large steamers passing up with material—half a million tons of gravel dredgings being removed—wharves had to be constructed, and an elevated rope railway on trestles constructed for the conveyance over the intervening 5½ miles of hill and glen of the materials used in the construction of the dam. Besides the large factories which have been erected for the manufacture of aluminium and allied industries, a compact little town has been built, connected with the two wharves at the head of the loch by an electric railway about three-quarters of a mile long. The town is on the most modern plan, with public and private electric lighting, and water supply and drainage on scientific principles. A permanent school is now being erected, and four different denominations are building places of worship for the spiritual needs of the permanent population. During the progress of the construction work 2,000 to 2,500 men have been regularly employed by the various contractors, and the cost of the undertaking has been nearly one and three-quarter million. Kinlochleven is situated about eight miles from Ballachulish (Glencoe), which is the terminus of the Caledonian Railway in the West Highlands. The consulting engineers for the main works, executed by Sir John Jackson, are Messrs. Meik, and for the turbines and electrical plant Messrs. Kennedy & Jenkin. The total cost of the scheme has been about 1½ million.

WARING'S

(WARING & GILLOW, LTD.)

Beg to intimate that they are prepared under the personal direction of Architects, to

BUILD, ALTER OR ENLARGE

Hotels, Public Buildings, & Town & Country Houses of any size.

The feature of their Constructional Work is Soundness and Stability, combined with Rapidity of Execution.

In Waring's vast New Building, recently opened, there are Departments for everything in connection with either Contract or Private Work, and Architects may be assured that their wishes will be faithfully and carefully carried out by efficient workmen under expert supervision.

Waring's manufacturing resources enable them to satisfy Architects' requirements at the lowest tender prices.

A NEW TEST FOR CONCRETE.

A PAPER was read on Monday last before the Society of Engineers by Mr. J. S. Owens, M.D., A.M.I.C.E., entitled "A New Test for Concrete." In this paper the author described the origin and application of a new test for determining the end of the mixing process in preparing concrete. He referred to a weakness in our specifications, which devoted great attention to the nature of the ingredients, but did not assure thereby a sound concrete, the quality of which depends to a great extent on thorough mixing. In the former case the nature of the materials is specified, but in the latter the method of mixing only. The author then went on to describe the test which he had devised, the object of which is to enable the engineer to satisfy himself that mixing is efficiently done. The methods which have been tried in the past to achieve this result were described, three such being referred to:—(1) Inspection; (2) making briquettes, breaking when set, and noting if of uniform strength; and (3) mixing pigment with the concrete, making briquettes, breaking when set, and examining fracture for even distribution of pigment. The author criticised these methods, and showed their lack of value for the purpose. He stated that it had been ascertained experimentally that inspection alone could not detect the difference between concrete having one part of cement to two of ballast and that having one to three.

The following definition of properly mixed concrete was then given:—"Concrete in which the various ingredients are as uniformly distributed as the size of the particles composing them will admit." He went on to say:—"The question therefore is how to determine when this uniformity of distribution has been attained." The principle on which the author's test is based was thus described:—"If we take a few small samples from different parts of the heap of concrete, and if we can tell in some simple way whether all the samples contain the same relative proportions of stone, sand and cement, we have a means of telling whether the concrete is properly mixed or not." The author's method of comparing the samples is simply to place each in a tall glass cylinder nearly filled with water, shake them up and allow them to settle. The rate of settlement of the cement in water was shown to be about thirty times as slow as that of sand; which, in turn, was slower than that of the larger particles of stone; this caused the stones, sand and cement to settle on the bottom in distinct layers. It was shown that the depth of these layers was proportional to the amount of the material present in the sample, and that in this way it was possible to tell whether each sample had the same amount of cement, sand, and stone.

A series of experiments bearing on the evolution of the test and its accuracy was then described, and tables given showing the results. The method of carrying out a test was gone into fully, and the results of some actual tests made by the author described. These include one of a concrete mixing machine, and several of hand-mixed concrete. The contrast between the uniformity of mixture obtained by the machine and that by hand mixing was forcibly brought out, as well as the evil effect of the human factor in hand mixing. Tables were given showing the results of these tests.

A summary was given showing the precautions necessary in making a test; and the author concluded by expressing the hope that the test would be of value in enabling engineers to determine whether their concrete was being properly mixed or not; and, in relation to mixing machines, in fixing the time necessary with any machine to mix properly, and thus to determine its legitimate output.

PAINTING STRUCTURAL STEEL.*

(Concluded from last week.)

THE adherence of paint would no doubt greatly increase if it were possible to heat the surface by artificial heat; however it is a good plan to apply the paint heated to a temperature of 100 to 120 degrees Fahrenheit, especially when the temperature of the air is below fifty-five degrees. This is easily attained by placing the cans of paint in pails of hot water.

* Abstract of a paper by Mr. Gaston Despierres, read before the Paint and Varnish Society, London, entitled "Paint and Its Application to Structural Steel."

It is important to always note the atmospheric conditions when painting is being done—a temperature of seventy degrees Fahrenheit, and an atmosphere free from moisture, favour the right kind of drying; in fact, the humidity is more harmful than a low temperature. Nothing retards drying more than dampness and darkness.

To aid in the inspection of new work, a shop-coating of linseed oil is often specified. This does, in a measure, protect the iron from rust; but a very uneven film of dried oil is often obtained by this method of treatment. Oil applied to a vertical surface runs off until the layer reaches a certain thickness. When the current meets with an obstruction it piles up into a thick and uneven coating. The thick parts of the layer may require months to harden into a substance firm enough to be fit to paint over.

The results are also most disastrous in cold weather, when oil thickens and contracts, and—as painters express it—"Oil, when applied to a cold steel, crawls, wrinkles and crinkles."

If oil is used as a primer on steel, it should be used hot, not warm; then it will penetrate the skin of the metal, and we shall probably obtain a thin and even film, hard enough to form a surface fit to receive paint.

Many places, such as the under and inner sides of girders, boltheads, nuts, rivets, &c., which should be painted with the greatest care to prevent the incursion of water, are often neglected.

To aid inspectors and clerks of works, a proper check upon the workmanship can be secured by selecting different colours for several coatings, so that the uncoated or defective places may be readily detected.

To secure durability with paint it should always be used fairly thick, and then well rubbed out with the brush into thin and even layers. An experiment with an ocular micrometer in connection with a microscope showed that a single coat of dried paint varied in thickness from 1/500th to 1/1000th of an inch, the difference being due no doubt to the manner of application—that is to say, whether under light or heavy pressure of the brush. We do not realise enough the thinness of a coat of paint, or the strains to which its dried film is subjected.

Much has been said and written of late regarding the apparent failure of paints enjoying a good reputation when applied to structural steel. From a limited personal knowledge, and from information gained from others, I am led to conclude that some contractors use less of the paint specified than has been presumed. What they do use is frequently applied in the open, under such unfavourable weather conditions, and under conditions of painting contracts at such a low rate as to preclude the possibility of either employing competent workmen to apply the paint, or such application of same as to prevent corrosion. The best paint in the world illegitimately thinned with cheap oils, japans or turpentine substitutes, is practically rendered of little protective value; and to apply it to structural steel more or less covered with rolling-mill scale, dew, frost, snow, slush, grease, &c., is waste of time and material throughout.

The only way to secure better painting is to employ competent and vigilant inspectors and clerks of the works, who will carefully superintend the painters' work.

The Testing of Paint.

Paint tests may be of three kinds—viz. chemical, mechanical and physical.

Chemical Tests.—A chemical analysis is applied to very small quantities of the substance used, and the accuracy of the results obtained from it depends largely upon the method of sampling. When one considers that all pigments are allotropic, that no two lots of paint liquids are really alike, and that any prepared paint changes more or less in one way or another with age, the chemists' test is proved to be of value, in so far as it relates to the matter, subject to his analysis and determination, and no further. "Essentially heterogeneous bodies excite chemical affinity." Can it be supposed that a chemist can possible know the affinities that exist between the various materials used by the paint-maker as well as can the competent paint-maker himself? The quality of a paint depends as much upon its physical as it does upon its chemical properties.

Mechanical Tests.—i.e. the tests made by a competent and skilful painter. No one can determine the working qualities of paint as well as the man whose eye, hand and arm are perfectly trained through practice.

The importance of the proper application of paint receives less attention than it deserves. A poor painter may use 50 per cent. more material than a good painter will use, and

get poorer results with it. Engineers and architects should demand the employment of competent artisans to do their painting, for results are quite as much dependent upon the intelligence and goodwill of the painter as upon the quality of the paint used. In confirmation of this, I may say that during all the years the company with which I am connected has been making tests of paints upon roofs, bridges and test-plates of wood, iron, steel, and glass (while, of course, results have often been non-concordant, and we have noted great difference in durability, covering and drying properties), yet we have never had the paint blister, scale, or peel off, the reason being that each coat has been applied under proper supervision by an expert painter, with thought and care, to a clean surface in a fit condition to receive it, and the paint was in each instance protected when drying.

Physical Tests.—By this is meant weather tests, or the exposure of the dried paint or metallic or other surfaces to the destructive forces of nature, or to agencies which are frequently present in atmospheric air that shortens the life of dry paint, such as acid, gases and vapours.

Comparative tests on limited surfaces—that is to say, small plates of steel or glass—are often misleading. In order to make such tests more reliable they should be repeated a number of times to note whether the results are concordant.

Actual service tests under normal conditions give the most conclusive data to guide us; but so long as it takes years to make them, common sense dictates that paint users are right in holding fast to materials that have proved trustworthy until better are found.

Accelerated tests under "abnormally severe conditions" have little value unless the results obtained by the method selected will be in complete harmony with "long time service tests." It is easy to test the effects of artificial heat upon dried paint, but this does not determine with perfect accuracy the power of the paint to withstand sunshine.

No quick test exists to determine the probable life of paint under given conditions; but one intimately acquainted with the properties of the paint, and with the forces of nature, may reasonably predict its life, if he knows the method of application, the conditions under which it is to be exposed, and the state of the surface upon which it is to be applied.

Efforts have repeatedly been made by various Governments and institutions to establish a standard in the testing of anti-corrosive paints; but when these specifications are carefully studied by a competent paint-maker he soon realises that they fail almost completely to secure that for which they were intended. A good many specifications only possess the advantage of relieving the monotony of daily routine by causing much amusement; in fact, some are quite impossible to fulfil.

Guided by the study of phenomena pertaining to subject matter, and reasoning by analogy from practice and experiments, the following conclusions can be reached with regard to structural steel coatings:—

1. That the surface of steel must be in fit condition to receive paint; otherwise it is better to use a cheap paint, tar, or anything.

2. That to know the probable results to be obtained from the use of paint materials one must know the following things about them:—

(*a*) Their history and mode of preparation.

(*b*) Their physical properties.

(*c*) Their chemical properties.

3. That a competent paint-maker can design a paint to meet any reasonable conditions of location, atmosphere, temperature, surface, application, drying and wear; but that in order to do so he must know the conditions; that these being known, he should be entrusted with the manufacture of a coating to accomplish the result desired.

4. That the priming coat upon the surface is the most important one, and that it should form a perfect foundation for those to follow.

5. That under coats should dry harder and more quickly than those above, and that the difference in drying and elasticity between adjoining coats should not be very great.

6. That the quality of the binder is equally as important as the quality of the pigment.

7. That the quantity or weight of pigment used is equally as important as its quantity or volume.

8. That the method of application is equally as important as the quality of the paint.

9. That no accelerated tests can be the equivalent of a lifetime service test.

Theory is practice applied to atoms and molecules.

Practice is theory applied to masses.

NOW READY,

PROUT'S CONTINENTAL SKETCHES

Proofs on Thick Plate Paper in Handsome Portfolio, Cloth, Gilt Lettered, Size 21 inches by 15 inches, Price 42s. Net.

The work consists of 75 Plates, and was originally published at 30 Guineas. The Plates are the full size of Prout's Drawings, and are an exact reproduction by the

PERMANENT INK PHOTO PROCESS.

Mr. RUSKIN, Author of "The Seven Lamps of Architecture," &c., &c., referring to these Drawings, says :—

"Prout ransacked every corner of France, Germany, the Netherlands and Italy."

"Prout was, and he remains, the only one of our artists who entirely showed Turner's sense of magnitude; and of all forms of artistic susceptibility reverent perception of true magnitude is the rarest.

"Numerous as have been his imitators, extended as his influence, there has yet appeared nothing at all to equal him; there is no stone drawing, no vitality of architecture, like Prout's."

"His 'On the Grand Canal, Venice,' is an Arabian enchantment, his 'Street in Nuremberg' is a German fairy tale."

"Prout drew every lovely street in Europe."

"I have," says Mr. Ruskin, "both in my earlier books and in my lectures at Oxford, spoken of the sketches of Prout with reverence and enthusiasm."

"The sharpest photograph is not half so natural."

"No architect, however accurate in his measurements—no artist however sensitive in his admiration—ever gave the proportion and grace of Gothic spires and towers with the loving fidelity that Prout did. This is much to say; and therefore I say it again deliberately, there are no existing true records of the real effect of Gothic towers and spires—except only Prout's."

May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON'S Bookstalls, or from the

ARCHITECTURE, FURNISHING, DECORATION, FINE ARTS.

E. LYON-CLAESEN, Publisher, 8 Rue Berckmans, Brussels.

The house makes a specialty of publishing artistic editions of all kinds—*editions de luxe*—and can supply all the works treating the subjects of Architecture, the Industrial and Decorative Arts, Furniture, Painting, Sculpture, the Fine Arts, &c.

TOURS ET TOURELLES HISTORIQUES DE LA BELGIQUE, or THE HISTORIC TOWERS AND TURRETS OF BELGIUM. From the water-colours of JEAN BAES. Among the architectural publications on the ancient edifices of Belgium, scarcely any can be found which give a reproduction of the admirable towers and charming turrets, so justly considered of the greatest interest. This work consists of 50 coloured folio plates, difficult to distinguish from the originals, mounted on handsome cardboard and contained in a rich portfolio. Price £4.

TRAVAUX D'ARCHITECTURE EXÉCUTÉS EN BELGIQUE, or ARCHITECTURAL WORKS EXECUTED IN BELGIUM. By HENRY BEYEART, Architect. This work contains the most interesting productions of Henry Beyeart, and presents, with fullest details, his principal edifices. It is the reproduction of his own designs arranged by himself. Each construction is explained by plans, details, elevations, sections, &c., drawn to scale. The work consists of 240 folio plates, in two portfolios. Price complete, £14.

L'EMULATION.

A MONTHLY JOURNAL. ORGAN OF THE "SOCIÉTÉ CENTRALE D'ARCHITECTURE" OF BELGIUM.

The latest volume of the New Series is in preparation, and will form a valuable addition to the Collection. Each number consists of four or five folio plates, eight pages of text, and a Supplement of twelve pages. It produces in chromolithography, heliogravure, phototype etching, &c., prominent examples of ancient and current architecture, and the text is devoted to this profession. The Supplement contains articles pertinent to architecture, and advertisements. Subscriptions date from January 1. Price per year, £1 8s The whole year, when complete, in portfolio, £1 12s.

E. LYON-CLAESEN, ART PUBLISHER, BRUSSELS (BELGIUM).

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

RUBEROID RED ROOFING
PAT. NOV. 22. 1904.
A PERMANENT ROOFING WITH A PERMANENT COLOR
Ruberoid Red Roofing
has all the merits of the Standard Ruberoid with the added attraction of a rich, handsome colour. This colour will last for years, and is not, like paint, simply a superficial coating requiring constant attention. The Colour of Ruberoid Red Roofing is an integral part of the substance of the roofing and, as such, will not wear off.
DO NOT SPECIFY ANY ROOFING UNTIL YOU HAVE SEEN SAMPLE OF RED RUBEROID.
Apply for Catalogue K and Samples.

SAVE 50%
OF YOUR
COAL BILL
BY USING THE PATENT
"Bond" Stove
Recent Testimonial.
Chelmsford, 12th January, 1909.
DEAR SIRS,—I have very great pleasure in stating the "Bond" Stoves have given me entire satisfaction, and I have no hesitation in saying, that if I were purchasing stoves for a new house I should, with my present experience, have all the fireplaces fitted with them. Apart from the great heat generated, and thoroughly distributed about the room, they are most economical in coal consumption.—Yours very truly,
(Signed) WILLIAM F. GEPP.

Scagliola Marble

An old Italian process, revived in the early part of the Sixteenth Century by Guido Sassi; is not a surface decoration, but a thoroughly artistic material. It was largely used by the Florentines in some of their most elaborate works, and was introduced into this country by Mr. J. Wyatt about 1750. It has been manufactured by this firm for the last 85 years, and fixed in many of the most important buildings in the Kingdom.

By Special Appointment

to His Majesty.

SPÉCIALITÉ for surrounding Iron or Brick Cores.

These being fixed in the ordinary course of construction the Scagliola can afterwards be fixed round **WITHOUT SHOWING JOINT.**

Prize Medals, 1851 & 1862.

TRADE NOTES.

MESSRS. WM. POTTS & SONS, LTD., Leeds and Newcastle, have received instructions to thoroughly overhaul a large turret striking clock at Denholme, Yorkshire, and fix new illuminated dials. They are also making and fixing a new stable clock in Cheshire.

THE new schools, Derby, for the Royal Institution for Deaf and Dumb, are being ventilated by means of Shorland's patent exhaust roof and special inlet ventilators, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

A LARGE chiming clock with three dials is to be erected on Rangemore church tower, Burton-on-Trent, as a memorial to the late Lord Burton by the inhabitants of Rangemore and neighbourhood. The work has been placed in the hands of John Smith & Sons, Midland Clock Works, Derby, who made the Burton-on-Trent town hall clock twenty-eight years ago for the late Lord Burton.

MESSRS. J. B. JOYCE & Co., Whitchurch, Salop, have received the order for a large quarter clock with two dials for St. Andrew's Church, Droitwich. The same firm have in hand clocks for St. Nicholas Church, Worcester; Deeping St. Nicholas Church, Spalding; Sambrook Church, Newport; Apley Park, Bridgnorth, and also one for the colonies.

AT Kettering it is proposed to build a dual school for 200 boys and 200 girls in connection with the secondary education scheme of the Northants education committee. The capital expenditure was estimated at 17,800*l*., and the annual expenditure 6,000*l*.

CORRESPONDENCE.

[The Editor will not be responsible for the opinions expressed by Correspondents.

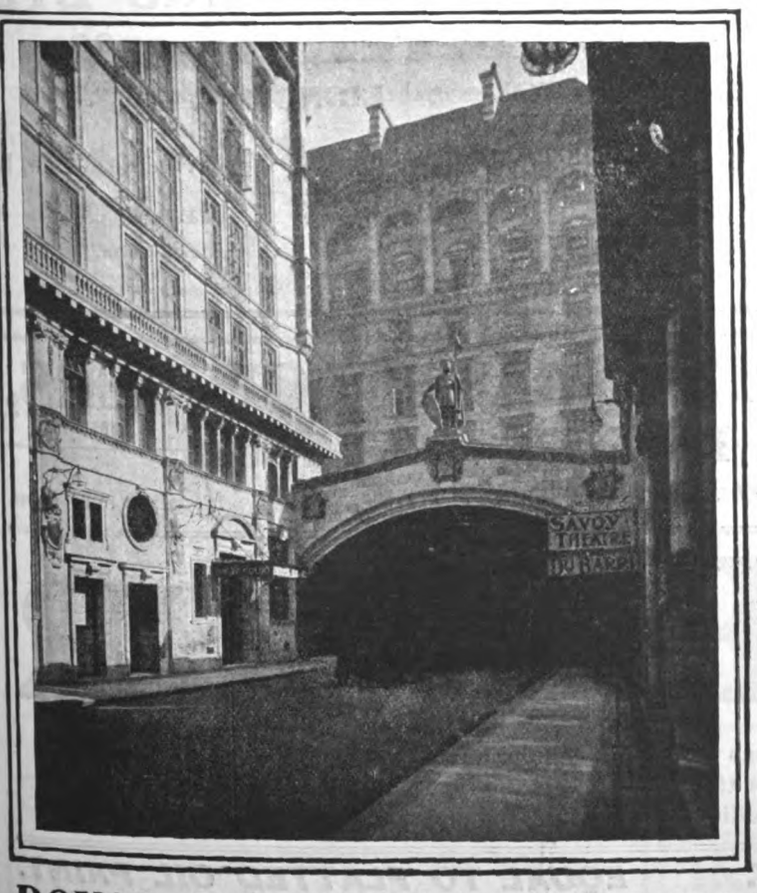
Altrincham Baths Competition.

SIR,—It is extraordinary how some public authorities take advantage of competitors, but I think the action of the Altrincham Council in the above beats all previous records: they have returned my drawings in this competition after keeping them for about two years.

Why they should not be satisfied with what they pay for, that is, the winning plans, I do not know; but to retain work they do not pay for seems most unfair and unreasonable.—Yours, &c.,

HENRY GOLDSMITH.

Manchester: March 5, 1909.



"Stikko?"

SIR,—We take the liberty of addressing you on the subject of ceilings. Our foreign friends have heard of a material called "Stikko," and ask us to procure particulars. They unfortunately can give us no information as to where it is made, and who are the makers, and it has occurred to us that you might be able to help us. We cannot say whether it is English, continental, or Yankee, but through the medium of your paper you may be able to put us on the right tack. Thanking you in anticipation, we are, yours truly,

COWIE BROS. & Co.

Glasgow: March 10, 1909.

AT the last meeting of the Loughborough Town Council a discussion arose on a proposal of the general purposes committee to pay the borough surveyor a fee of 5*l*. for preparing plans and alterations to the drill hall, which is to be used as headquarters of the 5th Batt. Leicestershire Regiment. An alderman questioned whether this was not within the province of the surveyor's duties, and thought that if the surveyor's duties did not include alterations to town buildings it was quite time some agreement in the matter was reached. It was opening the door wide for a pernicious state of things. An amendment to refer the matter back found little support, and was defeated by a large majority, only four voting in its favour.

VARIETIES.

THE War Office has decided to rebuild the stables and waggon sheds at the Royal Artillery and the Army Service Corps Barracks at Aldershot, at a cost of 25,000*l.*

THE Harrogate Corporation have received the sanction of the Local Government Board for the borrowing of 8,800*l.* for extensions to the Royal Baths.

A PERMANENT shelter for the audiences at the new bandstand in Leamington is to be provided. Both the shelter and the bandstand have been given to the town.

THE five different municipal housing schemes in Sheffield at present in operation have each proved a financial failure, involving a total loss of 6,261*l.*

THE Admiralty have accepted the tender of Mr. A. Carkeek, of Redruth, amounting to about 16,000*l.*, for the erection of Dockyard central offices on a site which is being cleared between Keyham main gate and the R.N.E. College.

THE Dunfermline Town Council have decided to advertise for a burgh engineer, on practically the same conditions as those existing during Mr. W. A. Bell's tenure of office, excepting that the salary offered is 250*l.* per annum.

PLANS for the extension of the Epsom Technical Institute and School of Art have been approved by the county authority and the urban district council. The cost is estimated at 1,300*l.*

THE architect of the Notts education committee has been directed to prepare plans for a school for 450 to 500 children, to act as an upper standard school for Kirkby-in-Ashfield, to be erected on the site in Cemetery road.

UP to March 31 last 22,921 cottages had been erected in Ireland under the Labourers' Acts. The number actually authorised to be erected up to date is approximately 44,000, not including 2,000 which are at present provisionally authorised.

THE City of London Corporation have adopted a report of the general purposes committee recommending the expenditure of 1,150*l.* in providing greater protection and means of escape at the Mansion House in the event of an outbreak of fire. The plans involve the addition of new exits, the erection of iron doors between certain rooms, and the setting up of automatic and other fire alarms.

A RADIUM Institute is to be erected on a site in Riding House Street, Portland Place, as soon as possible, according to plans by Mr. T. P. Figgis, 28 St. Martin's Lane, Cannon Street, E.C.

THE Oswestry Town Council have adopted a scheme for the purification of sewage and the treatment of storm water on land adjoining Maesbury Road. Application is to be made to the Local Government Board for sanction to borrow 6,000*l.* to carry out the scheme.

DUMFRIES Town Council last week considered a report from a committee regarding the proposed erection of a new town hall and municipal chambers. The probable cost was stated at 17,500*l.*, and the committee estimated that to finance it would entail a probable addition of 2½*d.* per 1*l.* to the rates. Consideration of the matter has been delayed for a month.

THE Westmorland County Council at their annual meeting on the 5th inst., framed a new bylaw with a view to preventing unsightly advertisements and hoardings, and a number of places were scheduled where such advertisements and hoardings cannot be placed, the only condition being that where they already exist they shall cease to do so at the expiration of five years.

THE Teignmouth Urban Council have decided to pay Mr. H. Jackson, A.M.I.C.E., for advising the Council in regard to the waterworks contract, a retaining fee of 26*l.* 5*s.*, 3*l.* 3*s.* a day for preparing the necessary statements, and a further fee of 26*l.* 5*s.*, and 5*l.* 5*s.* a day for preparing for and giving evidence in arbitration or other legal proceedings if such were taken.

A CORRESPONDENT of the *Scotsman* writes:—Notwithstanding all that has been said about the use of Norwegian granite at the Rosyth Naval Base, I am in a position to state that Messrs, Easton Gibb & Co., the successful offerers for the construction of the docks, have so large a financial interest in the Rubislaw granite quarries, in Aberdeenshire, that there is no doubt that a large quantity of home granite will be shipped from the Dee to the shores of the Forth. It is believed that the whole of the output of the quarries at Rubislaw will be utilised, and that, if that is not sufficient, the products of other quarries in Aberdeenshire will be drawn upon.

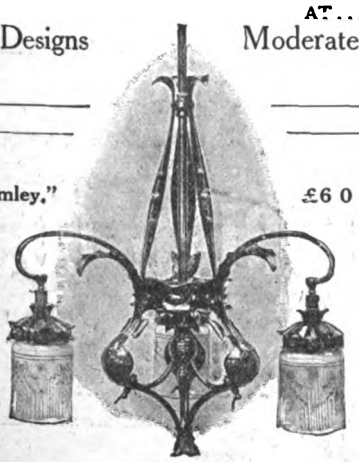
THE Brentwood Urban Council have passed a formal resolution approving of the amended estimate of Messrs. Willcox & Raikes for the drainage scheme. The original estimate of the scheme was 20,000*l.*, but it was thought advisable to make more provision for increase of population, and the 1,500*l.* increase is for the extra cost of the filtering beds.

SIR W. P. HARTLEY, of Liverpool, announced on Tuesday at the annual meeting of the Liverpool Maternity Hospital and Ladies' Charity his willingness to build a new maternity hospital with seventy-five beds (fifty for patients and twenty-five for the staff and pupils) for the service of the poorer people of Liverpool. The hospital will cost about 15,000*l.* The committee must find the site and an endowment fund of 20,000*l.*, limited to fifteen years must be raised.

THE designs submitted by Messrs. George Baines & Son, of 5 Clement's Inn, Strand, London, W.C., have been adopted for the New Southgate Christ Church Congregational church and institute, and the church section is to be proceeded with at once. The block is designed in late Gothic freely treated; a bold square tower is the main feature at the corner. Red-brick facings and stone dressings are to be used. Accommodation for about 600 persons will be provided.

MR. C. J. DAWSON, in his capacity as consulting architect to the Barking Urban Council, has been instructed to report upon (1) the capability of the present hospital site, as regards the proposed extensions; (2) the approximate cost of purchasing additional land adjoining the present hospital site; and (3) the advisability of removing the hospital from its present site to a new one of sufficient area to allow for the proposed extensions.



AT the request of the Local Government Board Mr. C. H. Priestley, waterworks engineer at Cardiff, has prepared a report upon afforestation at the Corporation waterworks in the Brecknock Beacons. The report states that some eight to ten acres of the mountain side of the Beacons reservoir was planted in 1906, and considerable loss had taken place there, but on the whole the trees were doing fairly well, considering that the situation was 1,400 feet to 1,500 feet above sea level. All the seedlings planted at Cwmtaff came from abroad, but he hopes that in future they will be obtained from local sources, as there is less loss with local seedlings.

AN interesting case under the Workmen's Compensation Act came before his Honour Judge Ingham in the county court at Evesham. Mrs. Mawson sued the Evesham Borough Council for compensation by reason of the death of her husband, Robert Collett Mawson, who had been borough surveyor for twenty-five years at a salary of 190*l.* a year, and had died in April last, leaving a widow and two young children. Counsel for claimant said that in January 1908, Mr. Mawson had to superintend the cleaning out of a most offensive pond in the recreation ground, which seemed to have been a rubbish shoot for the town, the contents including dogs, cats, tin cans, and vegetable matter. This affected his health, and he consulted a doctor on March 5, who attended him until his death. Dr. Gordon Evans said that Mr. Mawson suffered from severe laryngeal ulcerations due to septic poisoning. The cause was micrococci, which he had inhaled not more than two months before March 5. His Honour dismissed the application with costs, considering that the point was covered by the decision in the Court of Appeal where a workman failed to recover compensation for enteritis contracted while working in a sewer.

Now that public attention has been attracted to the subject of the country's defence, it may be of interest, a correspondent writes, to note the attitude of a great mercantile firm like the Royal Exchange Assurance to the question in past years. The corporation has been carrying on business for close on 200 years. A large part of their records were burnt in the destruction of the Second Royal Exchange in 1838. When England was in a ferment in 1798, fearing an invasion by Napoleon, a large contribution was made amongst the staff of the office towards the "Voluntary Contribution for the Defence of the Country," and in 1815 a substantial donation was made to the Waterloo subscription, while during the trying period succeeding the Indian Mutiny a fund was raised for the sufferers. To come to a more recent date, the corporation was well represented in the South African War, while the recent notice that the directors afford every encouragement to their staff serving in the Territorials, will keep their appointments vacant in the event of mobilisation, and have made money grants to cover the necessary expenses in the days of the Volunteers, are evidences that the attitude of the great business houses to the subject of national defence is as sympathetic as that of our predecessors.

HORSE GUARDS IMPROVEMENTS.

IN the House of Commons on Monday the First Commissioner of Works was asked whether his attention had been drawn to a scheme which was being put forward for alterations on a large scale in St. James's Park and the Horse Guards Parade; whether it had been submitted to and considered by him; and whether he had any intention of adopting or recommending these alterations.

In his reply Mr. L. Harcourt said:—I have seen some reference in the Press about this scheme, but I have received no official representation on the subject. I am sure my hon. friend and other members will be relieved to hear that I have not the slightest intention of doing anything to destroy the historic associations or the present beauties of one of the most charming of the London parks.

This statement was received, we are told, with "loud cheers." It would be interesting to discover how many of those present in the House had given any attention to the scheme proposed by Mr. F. W. Speaight for the improvement of the shapeless Horse Guards' Parade and the eastern half of St. James's Park. The First Commissioner apparently has made up his mind to condemn a scheme before he has in any way gone into it. The parade ground at present is shut off from St. James's Park by mean-looking railings. The proposal is to clear these away and construct a semicircular stone platform of impressive dimensions with the historic Achilles statue as the key stone, to finish the review ground. From its centre, running straight to Marlborough Gate, Mr. Speaight would then construct a broad, stone-flagged promenade, with a canal 40 feet wide and 500 feet long running through the middle. A series of semicircular recesses in the clipped hedges on either side of this broad walk would afford space for a series of military or historical statues, twelve of which would be removed from their present positions in various parts of London.

Messrs. J. Leaning & Sons estimate the cost of the scheme, including the purchase of nineteen new statues and the removal of twelve others, to be 58,750*l*., and they consider it could be completed in twelve months.

Mr. F. W. Speaight has been assisted in the architectural treatment by Mr. C. E. Mallows, F.R.I.B.A. The result of their joint labours is most satisfactory, and it is only to be hoped that the powers that be, or the powers that are to be, will not refuse to consider the scheme under the delusion that by so doing they are heroically saving the country from the Philistines.

MESSRS. FREDERICK WHEELER, SON & SEARLE, of 6 Staple Inn, London, W.C., have removed to 7 Stone Buildings, Lincoln's Inn, London, W.C., to which address all communications should be sent.

THE general purposes committee of the Middlesbrough Corporation recently considered a report by Mr. H. M. Taylor, the borough electrical engineer, on a proposed system of trackless trolley tramways. The route he suggested was a circular one of two and a half miles, which he estimated could be constructed at a capital expenditure of 12,000*l*. The estimated running cost would be 7*d*. per mile. It was decided to have the report printed and circulated amongst the members of the Corporation. An extensive system of track electric cars is at present run in Middlesbrough by the Imperial Tramways Company.

THE Dean of Winchester has received a letter from the consulting engineer, Mr. Francis Fox (Sir Douglas Fox & Partners), in which he states that he visited the work, and finding that a drift under the north wall of the chancel was nearly ready for inspection, made an examination under water. The depth of water was only 5 feet, the thickness of the peat 3 feet, thus showing that the level of the gravel bed is high at this point. The peat was of the same density and gravity as before, and the gravel-bed similar to and as good in quality as that in the previous drifts. The length of the excavation was 15 feet and the width 9 feet. The steel rods and girders are in place, and as soon as the Horsley Company send the few remaining bolts and angle plates they will all be finally tightened up and concreted and grouted in. A very great improvement has been effected amongst the disintegrated masonry of the north and south gables of the transepts, and none too soon. It was particularly interesting to see how thoroughly the grouting machine has done its work. On cutting into the wall to fix a loose stone, the crack could be seen completely filled up with cement. Every day is now rendering the cathedral safer and stronger than it has ever been.

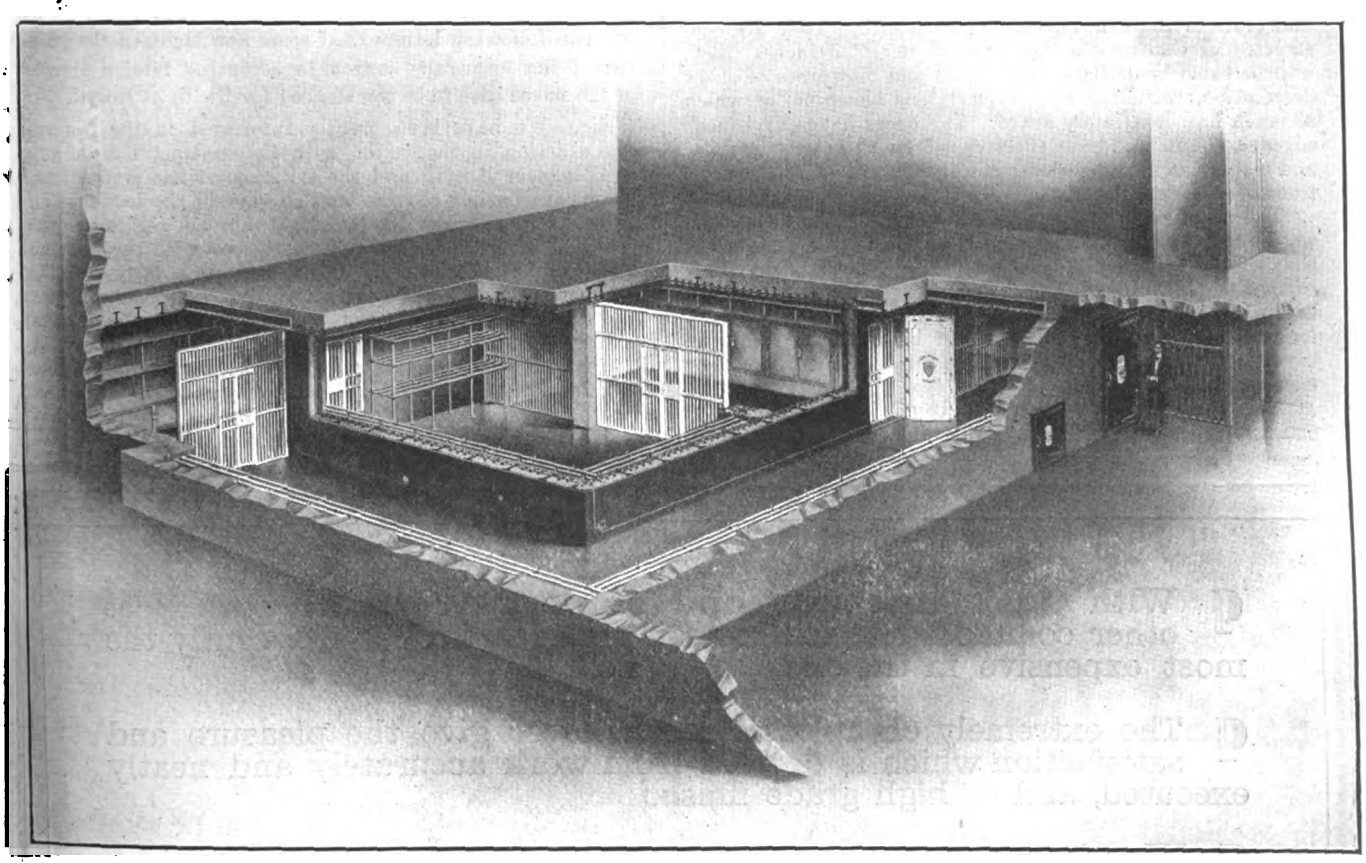
A TREASURE ISLAND.

IT is nearly two years since it was first announced that the Chartered Bank of India, Australia and China proposed to pull down Crosby Hall in Bishopsgate Street, E.C., and to erect bank premises on the site. Strenuous efforts were made to save this fragment of mediæval London but to no purpose. This development seems the climax to the chequered career of the structure during the 450 years which have elapsed since its erection by Alderman Sir John Crosby. At first a town mansion, then a royal palace, a prison, an embassy, a Presbyterian chapel, a warehouse, a concert hall, and finally a restaurant. This historic monument is, however, to be re-erected in Chelsea, and doubtless will endure for yet another four centuries. There is something appropriate in the new use of the site as a bank. Such an enterprise would have appealed to the merchant prince who helped to build up the commercial greatness of London.

Sir John Crosby amassed a considerable fortune as a grocer and woolman; in addition he was a public man on the approved civic lines, for he attained the dignities of alderman and sheriff, and was warden of his company. On his death the house was purchased by the Duke of Gloucester, who there hatched many dark schemes prior to his accession to the throne as Richard III. Its connection with the business life of London was re-established later when it was tenanted by a succession of wealthy merchants.



This long and distinguished connection with commercial London will be continued in its new use as a bank, having dealings with the East. The Orient has ever been the playground for imaginations that wish to run riot in pictures of limitless wealth of Indian nabob, Chinese mandarin, or Persian prince. All this comes within the range of the Chartered Bank, and in addition they tap the immense resources of Australia. The responsibility of safeguarding the treasure that comes to London from the East was vividly brought home to us by a recent visit to the underground portion of the Bank's new premises, where the strong room installation or stronghold is situated. The kernel, so to speak, of the stronghold, is a burglar-proof island strong room, a veritable "treasure island." The stronghold is situated in the sub-basement, and access to it is by the principal staircase, and by a lift direct from the banking room to its main entrance.

The general arrangement and construction are shown by the accompanying sectional perspective view, from which it will be seen that the burglar-proof steel strong room or "treasury" stands in the centre of a larger fireproof room.

The "treasury" is 32 feet 8 inches long by 25 feet 5 inches wide, and the outer or fireproof room is 55 feet long by 45 feet wide. The "treasury" is therefore surrounded on all sides by a fireproof corridor about 10 feet wide. The corridor is fitted with steel cupboards and shelving for books and documents, and the "treasury" with similar fittings for cash, securities, customers' boxes and other valuables.

Many obvious advantages result from this arrangement. The available space is most advantageously and economically utilised; control and supervision of the strong room and its contents are rendered easy and almost automatic, and the daily use of the surrounding corridor in the ordinary course of business ensures that the duration of any attack upon the "treasury" cannot exceed the time during which the bank is closed to the public. The structural advantages are still more important. The "treasury" (the steel roof of which extends over the corridor and engages with the outer walls) is in effect a central column of enormous strength capable of supporting the roof of the stronghold in the event of the collapse of the whole building in a fire. In these days of tall and heavy buildings, great structural strength has become the first essential in a bank stronghold, and this is effectively and ingeniously secured here.

After affording protection against fire, there comes the question of burglary. The burglar is limited as to the time at his command, and by the fact that he can only avail himself of portable appliances. A generation ago he was also restricted to the amount of power or energy which human muscles can develop. Now science has lent him her aid, and to-day he avails himself of stored energy in many forms, including the higher explosives (such as dynamite, nitroglycerine), acetylene, compressed oxygen, and the electric current. In the place of old-fashioned mechanical appliances, he has now an armoury of effective weapons furnished by the skill of the engineer, the chemist, and the electrician.

It is not however sufficient to provide against the methods in use to-day. Science makes constant progress, and in work of this permanent character it is needful to allow a sufficient factor of safety to ensure, as far as the limitations of human foresight permit, that it shall be adequate for future generations.

All these conditions are fully met in the stronghold of the Chartered Bank. Descent to the sub-basement can be made by the lift shown at the right-hand side of the illustration, which is close to the main entrance of the stronghold. This is guarded by one of Chatwood's patent strong room doors of massive construction, and by grille gates, the latter for use during the day.

This entrance opens into the fireproof corridor, fitted with shelving and cupboards for books and documents, and sub-

Digitized by Google

divided by steel grilles and gates. The facilities for convenient arrangement and ready access to books and documents so essential to the rapid transaction of business are very striking, not less so the excellent lighting and ventilation.

Interest however centres itself on the "treasury." This is, it is hardly necessary to say, of great strength and massive construction. It is built throughout (walls, floor and roof) upon Chatwood's self-contained and "interlocking rail armour" principle. This consists essentially of two steel rooms, the one built within the other, and the two braced together by steel girders, thus forming a complete box girder. The interlocking rail armour is upon the outer surface of the inner wall. It consists of steel flange rails rivetted to the inner plates with double-headed steel rails keyed between them. The cavities and interstices are filled with specially prepared granite and cement concrete. The walls are 11 inches thick. A structure of great strength and rigidity is thus obtained, and both the mass of metal and its ingenious arrangement render it secure against all descriptions of cutting, burning, or forcing apparatus as well as against explosives.

The "treasury" has two entrances and is divided internally into two sections by a steel grille with gate. The entrances are so placed as to allow of through ventilation during the day. The doors are of special interest as well as of vital importance, and are a splendid example of the art and craft of the safe maker and locksmith. They are constructed of Chatwood's "intersected steel" 3 inches thick, unpenetrable by drills, cutting tools and blowpipes of every description, including the oxy-acetylene blowpipe, of which so much has been lately heard. The doors have curvilinear edges, a simple and most effective safeguard against wedges, and patent solid flange lockcases, which defeat all descriptions of screw and lever.

The main boltwork consists of an arrangement of Chatwood's claw bolts, which effectually dovetail the door into the body of the room. The bolt mechanism is secured by their composite multiple-point lock and changeable key lock, the keys of which can be changed without the intervention of a locksmith. The keyholes are closed by eccentric revolving key-hole plugs, which are in turn secured by their combination letter lock.

As the "treasury" with its extended roof, doors and fittings weighs some 400 tons, its erection in a sub-basement has been a difficult undertaking, but it has been carried out without a hitch or interference with the general progress of the building.

All the parts of this huge safe fit with an accuracy which a watchmaker might envy, and the finish of the whole is admirable. The ventilation is such that the staff can work in any part of the stronghold with the same comfort as in the banking room itself.

The work has been carried out by the Chatwood's Patent Safe and Lock Company, Ltd., from the designs of S. R. Chatwood, M.I.Mech.E., who has superintended its construction and erection. One expects much from Chatwood's, but in this case they appear to have done more than justice to their long-established reputation for sound design, strong construction, and fine workmanship. The results of their research and invention during fifty years seem to be brought to a focus in the design of the Chartered Bank stronghold, which affords a satisfactory solution of one of the most complex problems in engineering practice.

The Bank are to be congratulated upon the possession of a stronghold in every way well suited to the purposes of a large banking business.

THE ROSYTH CONTRACT.

THE two following letters shed some new light on the question of the Admiralty action in accepting foreign granite for the naval base to be commenced forthwith at Rosyth:—

Sir,—We have been greatly interested in the Government's action in connection with the contract for the new naval base at Rosyth and the criticism it has evoked from various responsible parties, and in view of the fact that an erroneous idea seems likely to get abroad regarding the ability of English quarry masters to cope with the work we are desirous that matters should be explained fully. In the first instance, when the contractors who were tendering for the work sent out schedules to various English and foreign producers, they were asked to quote alternative prices for British and foreign granites. It must be mentioned here that the substantial and primary reason why Norwegian granite can be produced cheaper than British granite is that the Norwegian quarries are more favourably situated for

¶ With **Oak Panelling and Joinery Work,** as with most other commodities, the lowest priced article is frequently the most expensive in the end.

¶ The extremely cheap article can never give the pleasure and satisfaction which is derived from work accurately and neatly executed, and of high grade finish.

¶ We aim at providing only first class workmanship at prices which will be found but slightly beyond those paid for work of inferior description.

¶ We have just issued a revised and much reduced Price List, which we shall be happy to post upon application.

¶ We are exhibiting at the **Building Trades Exhibition,** at **Olympia, April 17** onwards, same position as in 1907, and hope you will favour us with a visit and satisfy yourself as to the accuracy of our assertions.

obtaining the stone. In most of the British quarries, notably Aberdeen and Cornwall, the stone is below the surface, and a great deal of labour and capital has to be expended before the quarry can be put into a position to obtain blocks of the sizes required for dock work, &c., whereas in Scandinavia all this cost is saved—the granite lying upon or very near the surface—and in many instances extending over a large area and lying adjacent to the deep waterways or fjords. Thus, at the outset, the Scandinavian firms have an advantage over the majority of the British quarries. Now, it has been stated that, apart from the difference between the cost of Norwegian and Aberdeen granites the reason for placing the order abroad is that the only English firm who could have taken over the work and completed it within the required time is full up for the next two or three years. We must enter our protest against this statement. There are, it is true, only two places in England where the work could have been taken over and executed successfully, one in Cornwall (which, as stated, has sufficient work for the near future), the other, our own quarry, situated at Shap, in Westmorland. A great deal has been made of the difference between the British and foreign prices, but we claim that we could undertake to supply the whole of the granite required well within the time limit at a price equal to, or within a reasonable margin of, the working price of the foregn granite. We can do this and guarantee to be paying the rate of wages recognised in the trade as the standard for the particular class of work for which that rate is paid, because we have a quarry more accessible for working than any other British quarry, one which can—as we can prove—produce larger blocks than any other quarry in the kingdom with greater ease—a quarry with a working face of granite half a mile long and 50 to 60 feet high, with an almost inexhaustible supply of material, and which is equipped with the most powerful cranes and the most modern labour-saving appliances known to the trade. You will doubtless think it strange that, with all these facilities, we did not submit our tender when requested to do so by the contractors, but the explanation is not far to seek. We are, unfortunately, situated in a position where our only outlet is by rail; we are controlled by the rates charged for carriage by the amalgamated railway companies of the country, and we are so hemmed in by the rates that it is impossible for us to compete successfully in contracts where foreign granites can so easily be procured and carried. The saving we should effect in the working is counterbalanced by the additional cost of transit, this latter proving an effectual bar to our successful competition against foreign granite. We wonder if your readers are aware what is being done in such circumstances for our Continental competitors. We suppose not. Take the attitude of the Continental Governments who, under such circumstances and such conditions, purchase the material at the quarries and make their own arrangements as to carriage, the latter charge being merely a nominal sum for a considerable distance, thus keeping their huge quarries and works employed and money circulating in their own country. The foreign Governments have recognised that if their people are to be fully employed and their commercial prestige advanced, they must help the many industries to compete successfully in other markets, and thus they are ousting home productions in nearly every trade. Now we come to our point. If the British Government would follow the example set by the foreign Governments and lend their aid to getting the granite conveyed from our quarries to Rosyth at, say, the same cost as it would take to bring the material from Scandinavia, there would be no need for the order to be placed abroad. The work could be done in England by skilled workmen, and provide a means of livelihood for many hundreds of people, as the entire population of Shap village (nearly 2,000), and many from neighbouring villages, are dependent solely upon the Shap granite quarries and works for their existence, apart from the fact that the work would be undertaken on competitive prices and the money paid and be circulated entirely in the country. We might mention that the granite for the Southampton Docks was supplied some years ago from our quarries, and amongst recent contracts which we have executed are the Heysham Docks for the Midland Railway Company, the large granite blocks required for various railway extensions in the North of England, while we are now shipping a large consignment of our granite to South America for dock and railway work there.

We trust you will pardon the length of this letter and its encroachment upon your space, but we think it only fair to the public (who will in the long run have to bear the cost) that they should be aware what are the conditions which

THE "DRAWWELL" GRATE

WAS PLACED

First in the Final Tests

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjunction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public and private buildings.

N.B.—All Grates bear the Trade Mark and Name of "Drawwell" on firebrick to Insure against Imitation.

prevent English quarry owners from entering into competition for work of this nature with any possibility of being successful.

We are, dear Sir, yours respectfully,

THE SHAP GRANITE CO., LTD.

Albert Square, Manchester: March 1, 1909.

Sir,—In view of the great interest which is being displayed and the controversy which is taking place both in the House of Commons and in the Press as to the use of Norwegian granite in this country, more particularly for the new contract at Rosyth, we feel it is incumbent upon us, being largely interested in two Scandinavian companies, and also being interested in several British granite quarries, to place the actual facts before the public from an unbiassed point of view, which we are in a position to do having interests on both sides.

Let it be understood, in the first place, that in this country the sources or districts from which granite is obtainable are limited, particularly so for large blocks. On the other hand Nature, which has favoured most countries in some respects, has provided Scandinavia with the finest deposit of granite in the world, of varying degrees of hardness and many different shades of colour, especially suitable for paving, architectural, monumental, and dock work, to such a degree as to place it beyond comparison with any other country in Europe, and probably in the world. These deposits of granite lie in level beds in varying thicknesses, and it is possible to obtain any size of block required and in any quantity—for instance, we could cut all the granite required in the Rosyth contract from a small portion of one of our quarries alone, as also could others, and we should like to emphasise the fact that this work would be undertaken by British workmen whom we sent out during the period of depression in the granite trade here, and who are so satisfied with their earnings and the conditions under which they labour that they have settled in Norway.

It has been stated in some papers that the wages earned by the dressers, or stone workers, in Norway only amount to a few "ore" (or pence) per day; others have termed it "sweated" or "convict" labour, but there is no truth whatever in these statements. The Norwegian and Swedish quarrymen are quite as well paid, if not better, than the English stone-dressers, their average wages being from 6*s.* to 8*s.* per day, and these rates are controlled by the respective trades unions.

It has also been stated that Scandinavian granite is not so good or so durable as British. This is incorrect, and the impression is no doubt conveyed by the only experience of Scandinavian granite being of one of the inferior classes. Let us here say that you can obtain in Scandinavia the hardest granite for setts and kerbing, the latter in lengths which it is absolutely impossible to quarry in any other country. Moreover, from the variety of the granites to be obtained Scandinavia is unequalled as a source of output for material for decorative, art, or building purposes.

It is merely a case of natural advantages, and quite apart from the question of labour, which does not enter into the matter at all, as in addition to the advantages enumerated above, the Scandinavian quarries lie alongside the fjords—which are deep waterways—where steamers can practically load at the quarry under the cranes without any cost of intermediate transit. Contrast these with the only two well-known competitive British districts, Cornwall and Aberdeen. In both these districts the blocks have, first of all, to be quarried at a depth of one or two hundred feet, hoisted to the top of the quarry, and placed in positions for the masons to work, and when ready for despatch have to be loaded into wagons, carted three miles or more to the quay, loaded from the wagons into the steamers, all of which tends to make the prime cost of Aberdeen or Cornish granite much in excess of that obtained from Scandinavia.

We trust that this explanation will enable the public to grasp the true position, and see that many of the statements already published are quite the reverse of the true facts, and very prejudicial to the well-being of many British subjects, as well as to an industry which has provided the means for the better paving of most of the important thoroughfares in this country.

We are, dear Sir, yours respectfully,

NEWTON BROOKE, Managing Director
(BROOKES, LTD.).

Halifax: March 5, 1909.

On the mixing of

Hall's

Sanitary
Washable

Distemper

¶ The stiff material is sold in tins and iron kegs.

¶ This only requires the addition of water to be ready for use.

¶ Cold water can be used, but warm water is better.

¶ Mix to the consistency of a thick cream, and apply in this way.

¶ Do not imagine that the more water you mix with the Distemper the further it will go; this is wrong.

¶ Remember the right consistency is that of a thick cream or oil paint. Used in this way, you will find one coat is in most cases sufficient, even on new work, and will give a result equal to two coats of oil paint.

¶ Five pounds of Hall's Distemper properly used will cover about 20 square yards.

¶ The modern style of decoration with Hall's Distemper walls, with Picture Rail, "Sisco" White Japan for the woodwork, and Hall's Distemper frieze is in popular demand. It is a quick and money earning decoration, and makes highly satisfied customers.

Please apply for sample shade-card and full particulars to the Sole Manufacturers—

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

EASTLEIGH.—March 24.—The London and South-Western Railway Company invite competitive designs for the construction of a hall, to be erected adjoining the Railway Institute Buildings at Eastleigh, near Southampton. MR. G. CHRISTIE, engineer and manager of the Brighton Corporation electricity works, estimates the probable capital expenditure to meet the requirements of the undertaking during the next five years to be 34,620*l*.

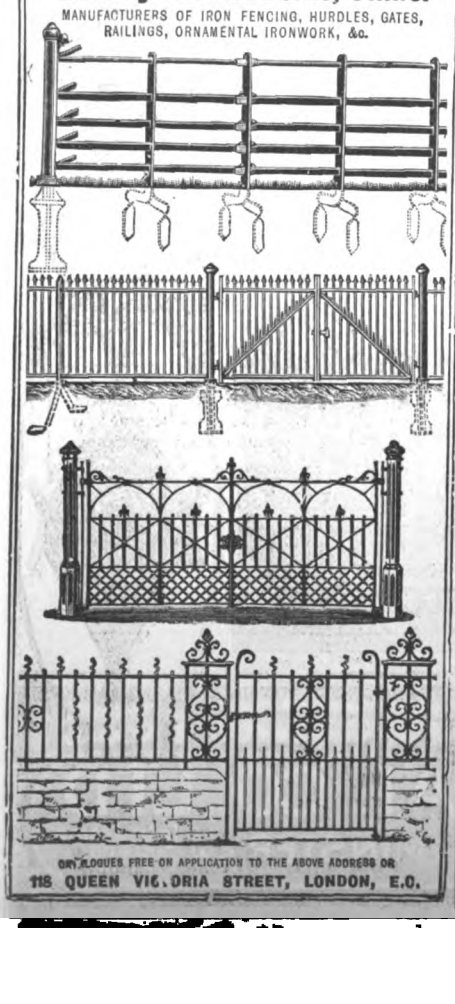
TRADE NOTES.

THE Underfeed Stoker Company, Ltd., Coventry House, Finsbury, E.C., have received the order to supply mechanical stokers at the municipal electricity works, Walsall, at a cost of over 2,000*l*.

WE have been requested to announce that owing to the growth of the business the proprietors of *Page's Weekly* have been compelled to move to more commodious premises at Lennox House, Norfolk Street, Strand, London, W.C.



MACKAY'S patent direct-acting ventilators, supplied by Messrs. Cousland & Mackay, Glasgow, the sole makers, have been used in the ventilation of the Central Senior School, Gourock, now being erected from the plans of Mr. Alex. Cullen, F.R.I.B.A., Hamilton.

MESSRS. PATMAN & FOTHERINGHAM, builders and contractors, Theobald's Road, W.C., have been successful in obtaining the contract for some extensive alterations at Shaftesbury Theatre, Shaftesbury Avenue, W., under Mr. Frank A. Tugwell, architect, of Scarborough. The theatre was originally built by them.

MESSRS. WM. POTTS & SONS, LTD., clock manufacturers, Leeds and Newcastle-on-Tyne, have received an order for a new illuminated hour-striking clock for Lancashire, and one not to strike for Cheshire, and to fix new large illuminated dials to a four-dialled striking clock, and restore the clock near Bradford, also to clean and restore a clock erected by them about sixty years ago, and clean and restore another one made by some other firm.

THE Chapel-en-le-Frith Rural District Council on Monday decided to carry out a water scheme for Wormhill, at a cost of 2,225*l*. The only supply at present is from a well and fountain erected to the memory of James Brindley, the great canal engineer.

AN "Everything for the Home" Exhibition is to be held in the Bingley Hall, Birmingham, October 6 to 23. It is being organised by the International Trade Exhibitions, Ltd., who were responsible for the recent Midland Counties Building Trades Exhibition, and many others. The chief divisions will be construction, sanitation, decoration, ventilating and heating, lighting and furnishing.

VARIETIES.

MR. J. RYECROFT, late chief architectural assistant under the Corporations of Lancaster and Bradford, has been appointed quantity surveyor and general assistant in the Sheffield City Architect's department, at 180*l.* per annum.

THE Sheffield Master Plumbers' Association recently wrote asking that two of their representatives be placed on the town-planning committee of the Corporation. This matter was referred to the special town-planning committee.

THE Local Government Board have sanctioned a loan of 25,000*l.* for the cost of carrying out schemes of sewerage and water supply for the district of Aspley Guise, Aspley Heath, and Woburn Sands.

MONTROSE Town Council have resolved to erect an additional storage reservoir and filtration plant for the burgh water supply. The work agreed upon is part of the scheme, involving an expenditure of over 10,000*l.*, propounded by Mr. Bennett, C.E., Edinburgh.

THE sewerage committee of the Aberdeen Town Council who have had the question of completing the Girdleness outfall scheme under consideration, have agreed to recommend the Council to proceed with it as soon as possible. The work will entail an outlay of between 50,000*l.* and 60,000*l.*

THE Dudley Guardians have instructed Mr. Stanley Eagles to further report upon a modified system of workhouse drainage, having regard to immediate requirements, with provision for extensions if necessary. The report was adopted.

THE plans and works committee of Edinburgh Town Council recommend the provision of a mechanical fire escape and water tower for the fire brigade at a cost of 750*l.* The ladder, which will extend to about 90 feet, can be raised at any angle up to 60 degrees in 30 seconds.

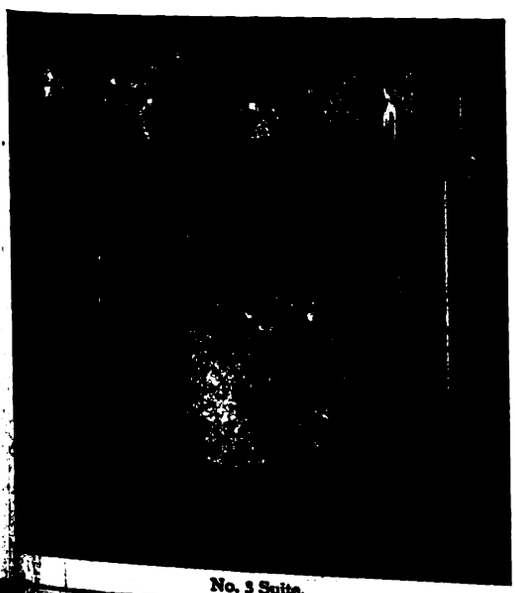
THE Harpenden Urban District Council are applying to the Local Government Board for a loan of 31,500*l.* for the purpose of inaugurating a sewerage scheme for the urban district, and for a provisional order for the compulsory purchase from Mr. Basil Loder of a portion of his estate. An inquiry into the matter has been held at Harpenden by Mr. M. K. North.

THE Water of Leith Purification Commissioners have decided to proceed with new works at a total estimated cost of 4,400*l.* These include the laying of surface water drains at Juniper Green at an estimated cost of 1,500*l.*, at Colinton at an estimated cost of 750*l.*, and at Corstorphine at an estimated cost of 1,550*l.*

MR. J. A. CROWTHER, borough engineer, Southampton, has been granted three days' leave of absence in addition to his ordinary Easter holidays for the purpose of enabling him to take part in the visit that is being arranged to the Continental cities that illustrate town-planning. Mr. Crowther will pay his own expenses.

THE Crowstone Yacht Club, Westcliff-on-Sea, have had plans prepared for a club-house, comprising a saloon capable of seating 250, a smoking lounge, a ladies' room, &c. The building will cost upwards of 1,000*l.* It will be erected on piles driven into the foreshore, and will be approached from the leas by a jetty.

IT has been decided to proceed with the erection of a new church for the district of Bramhall, Lancs. The scheme is to be divided into two parts, and the first portion will cost about 4,000*l.* The sum of 3,400*l.* has been raised, and it is expected that the building will be opened free from debt. The sum of 7,500*l.* is put down as the cost of the scheme.



A COMMITTEE of Dundee Town Council recommend the Town Council to experiment with a trackless tramcar line at an estimated cost of 5,000*l.* The proposal is that the cars should run from the centre of the city along the Esplanade and join with the existing system at a point two miles further west. The cars will only be run during the summer months, and in good weather.

THE Local Government committee of the London County Council report that up to December 31 last particulars of 30,358 estates had been obtained and defined on the ground plan of London. Particulars had also been obtained in regard to 942 estates which had not been recorded on the Ordnance sheets. Negotiations are proceeding in regard to about 2,000 estates. The total area dealt with is 112 square miles 357 acres, leaving about three square miles to complete the plan. The total cost of the plan up to the end of last year was 14,477*l.*

AN extensive Government contract has been secured by the Consolidated Pneumatic Tool Company, Ltd., Fraserburgh. The order is to supply 300 electric drills, at an average cost of 50*l.* each, the total contract thus amounting to 15,000*l.* This is the largest Government order ever placed in Fraserburgh. The tool works at present employ 150 hands, but provision is being made for additional mechanics.

A LOCAL Government Board inquiry was held last week at Bury into an application by the Town Council for sanction to borrow 43,000*l.* for the purpose of relaying about a dozen streets with granite setts. The borough engineer said the streets were main lines of traffic, and it was necessary, owing to the heavy motor vehicle traffic, that the foundations of the roads should be strengthened and that stronger surface setts should be used.

THE City of London Corporation have arranged to send a deputation of members of the streets committee to visit certain cities on the Continent, to observe and report upon the various systems of gas and electric lighting in operation there, with a view to the comparison of the methods in use in the City of London. Among the places visited will be Paris, Berlin, Vienna, Brussels, Cologne, Dresden, Hamburg, and Düsseldorf. The deputation left on March 18, and will be away a fortnight.

THE plans for the Bunyan memorial window in Westminster Abbey have been finally approved by the executive committee, and the work will be undertaken forthwith. Mr. J. N. Comper, the artist, has accepted the suggestions made by the committee at its last meeting, and has made some slight changes in his design for one of the scenes. The window in the north aisle selected for the memorial is the first to the right of the usual entrance.

A REMARKABLE undertaking for the development of electric power is reported from Halifax, Nova Scotia. An application has been made to Parliament for a charter authorising the damming of the head of the Cumberland Basin, the Basin of Minas, and several other streams emptying into the Bay of Fundy, with the object of utilising the tidal flow to develop electric power for sale in New Brunswick and Nova Scotia. There is a tidal flow of about 40 feet in the Bay of Fundy, from which it is believed that an immense amount of power can be developed.

A CONFERENCE of representatives of local authorities was held in connection with the Smoke Abatement Exhibition, in Sheffield. Representatives attended from most of the principal cities and towns throughout the kingdom, including London, Birmingham, Manchester, Bradford, Darlington, Middlesbrough, and Kendal. A committee of representatives of local authorities, manufacturers, and voluntary associations was appointed to consider the question and take steps to put the movement on a permanent national footing.

AT a meeting of Inverness Town Council last week considerable discussion took place as to whether new police buildings on a new site should be erected, or whether the Council should acquire property at the back of the present police station, and bring the old buildings up to modern requirements. It was ultimately resolved to purchase the property behind the present building, and to invite architects in Inverness to send in competitive plans for the alteration of the buildings.

FOR certain work urgently required in connection with the Gibraltar Dockyard extension, the Admiralty accepted a tender over 600*l.* higher than the lowest submitted, the accepted contract providing for delivery three months earlier than the lower tender. As, however, delivery was not made until after the date promised in the rejected tender, the Comptroller and Auditor-General inquired whether the question of a penalty for the late delivery had been considered, and in reply he was informed that the contract did not embrace any clause covering late delivery.

THE Yarmouth borough surveyor having submitted his report on 159 advertising signs overhanging from the front of buildings in the Market Place, Regent Street, King Street, and Regent Road, the Town Council resolved that no advertising signs be allowed to be erected over the public highways of the borough without the consent of the Corporation. That all advertising signs over the public highways under 8 feet in height from the street level be prohibited. The borough surveyor is to prepare and submit to a future meeting a list of all advertising signs exceeding 3 feet by 2 feet now erected over the principal highways of the borough. No flags, posts, or ropes are to be erected or placed over the public highways, except on occasion of public festivals, and then only for ornamental purposes.

SAMPLES SENT ON APPLICATION.

Digitized by Google

OUR attention has been called to a recent development of the confidence trick. Professors of that craft, taking a hint from the usual practice of public authorities in inviting open tenders by public advertisement, have sent out circular letters to respectable firms stating that tenders are required for certain work, somewhat, but not too indefinitely described. Applications are to be sent to an individual of an assumed name, by post, and accompanied with a 5*l.* note, in return for which are promised, after an interval, plans specifications, and quantities. Those who are honoured with an invitation to tender from persons unknown to them should make inquiries before parting with the 5*l.* note.

THE housing committee of the Liverpool Corporation have received a statement of the approximate balance of debt and present net charge in connection with demolition and housing in Liverpool. On December 31 last the balance of debt on demolition was 206,916*l.* 6*s.* 2*d.*, and on housing 469,269*l.* 3*s.* 1*d.*, a total of 676,185*l.* 9*s.* 3*d.*, interest and sinking fund amounting on the former to 12,686*l.* 4*s.* 4*d.*, and on the latter to 26,430*l.* 16*s.* 5*d.*, a total of 39,117*l.* 0*s.* 9*d.* From this has to be deducted 9,537*l.* 19*s.* 3*d.* for net rents, leaving the present net charge at 29,479*l.* 1*s.* 6*d.* The approximate total cost of housing and demolition, after allowing for sums realised by the sales of surplus land, to December 31 last was:—Housing, 545,942*l.* 10*s.* 11*d.*; and demolition, 357,479*l.* 16*s.* 7*d.*; total, 903,422*l.* 7*s.* 6d. By the deduction of 146,337*l.* 5*s.* 2*d.*, the cost of unrestricted buildings in Victoria Square, Juvenal Street, and Arley Street, the housing account was reduced to 399,605*l.* 5*s.* 9*d.*, on which the sinking fund and interest for 1908 amounted to 19,867*l.* 6*s.* 8*d.*

MR. ELLIS DAVIES, M.P., asked the Home Secretary in the House of Commons whether, in view of the opinion of the departmental committee on industrial diseases that fibroid phthisis exists amongst workmen in slate quarries, any effort had been made to protect the workers in that trade from the effects of dust inhalation by special rules or otherwise, as had been done in the Potteries and in the mines of Cornwall and Devon. Mr. Gladstone, in reply, stated that the committee on industrial diseases reported that the incidence of fibroid phthisis in slate quarries had been established in some instances, though there is no evidence that the disease prevails to a serious extent. The question, however, of extending the precautions adopted in the Cornish mines to all cases in which dust of an injurious character may be produced by rock-drilling has not been lost sight of, and the working of the existing rules is being carefully watched. The Royal Commission on Mines are shortly to reach that part of their inquiry which has to do with conditions of health and safety in metalliferous mines and quarries, and he thought it would be desirable that the matter should be considered by them.

THE Society of Engineers, 17 Victoria Street, S.W., will award a status prize each year for the next five years, ending 1913 (if papers of sufficient merit are received), for the best paper written by any person on the subject of "How to Improve the Status of Engineers and Engineering, with special reference to Consulting Engineers." The prize will be three guineas' worth of books and/or instruments to be chosen by the successful author. The essay shall not be more than 6,000 words in length and shall be typed on one side of foolscap paper, the distance between the lines being $\frac{5}{16}$ inch or more. The papers for the present year shall be sent in on or before June 30 next, addressed to the Secretary of the Society of Engineers, 17 Victoria Street, Westminster. The successful paper shall be read and discussed at a meeting of the Society, the reading, if possible, being done by the author. The paper shall be published in the usual manner in the Transactions of the Society. The Society of Engineers, the Civil and Mechanical Engineers' Society and/or the donor of the prize shall have the right to publish any paper sent in for the competition.

THERE are so many kinds of directories that the feeling of wonder which on first acquaintance they arouse becomes somewhat blunted, and a purchaser quickly loses any power of marvelling at the amount of minute labour embodied in the pages. But there is one directory that is still able to inspire us with astonishment by its contents, and that is "The Mercantile Year-book and Directory of Exporters," published by Lindley Jones & Bro., 21 St. Helen's Place, E.C., which has attained its twenty-third year of publication. It opens with eleven itineraries, giving the names and exact addresses (including the floors) of London merchants in strict order, the goods shipped and the ports. This has

its own alphabetical index to the streets. Part II. gives the importers in British colonies and foreign countries, with their representatives and buying agencies in Europe. Part III. gives the principal classes of goods shipped from London, with the names of the shippers. Part IV. consists of the merchant exporters of London, with their addresses, telegraphic addresses and telephone numbers, and the markets with which they trade. Part V. deals with the exporters of Manchester, Liverpool, Birmingham, Glasgow, Bristol, Bradford, Leeds, Nottingham, Huddersfield. Part VI. gives the same information about the exporters of Paris, Hamburg, Berlin, Bremen, Amsterdam, Rotterdam, Antwerp. The compilation of such a directory may truly be called prodigious.

THE American Consul at Turin calls attention to the extensive supplies which will be needed for rebuilding the Italian cities destroyed or damaged by the earthquake. The reconstruction of the cities of Messina, Reggio, Palmi, Bagnara, &c., having been decided upon, the Italian Government will, as soon as the debris left by the earthquake has been cleared away, direct the engineer corps of the civil state, or a special commission composed of members of that corps, to proceed to divide the areas selected for reconstruction into building lots. These lots will be bid for by Italian and foreign contractors who may wish to undertake the construction of new buildings thereon. The Public Works Co-operative Society of Lombardy announces that it will hold a public competition to demonstrate the relative merits of various materials and methods of work and construction adapted for use in the devastated regions. The competition will deal especially with types and systems of construction for urban, rural, and industrial edifices least likely to be affected by seismic disturbance, and the Italian Government will probably hold a special competition for the solution of purely technical problems. This competition will, however, only take place after the Government shall have solved the grave financial and administrative problems that now demand its attention. It seems likely that steel and reinforced concrete will be widely used in the work of reconstruction, and that the height of buildings will be limited to 32.81 feet. It is probable that only the very lightest materials will be used for floors, ceilings and roofs.

BUILDING AND BUILDERS.

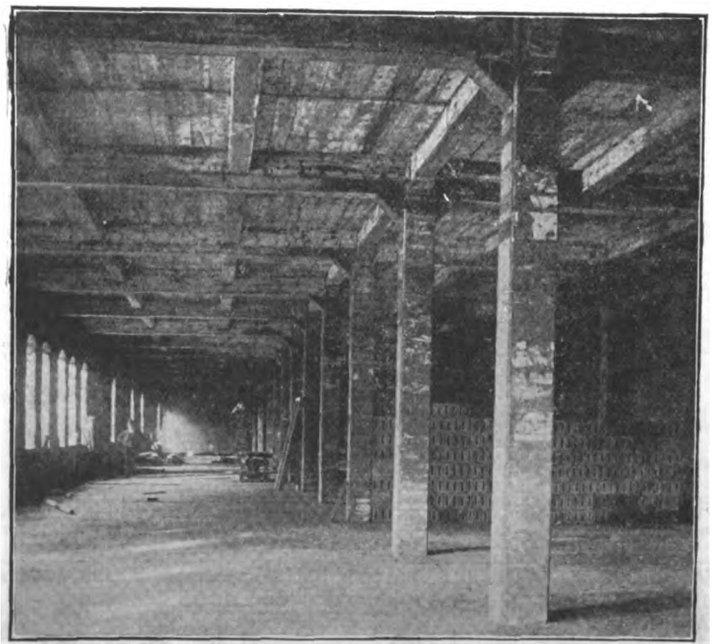
MESSRS. H. & J. MARTIN, contractors, Dublin, are carrying out extensive alterations to the Phœnix Park residence of the Hon. Walter Guinness.

THE Estimates 1909-10 vote 15,000*l.* for the new recruiting station at Great Scotland Yard, and 19,000*l.* for the extension of the National Gallery over part of the present barrack site. For the additional law court in the Strand 16,000*l.* is taken, and among other votes are 300*l.* to improve the lighting of Big Ben and 300*l.* for a children's playground in Kensington Gardens.

THE Brighton Corporation are about to give official notice to architects and builders that the conversion of a building into more than one flat or dwelling-house constitutes a new building within the meaning of the regulations, of which due notice must be given, and plans submitted to the authorities.

THE Eastbourne Board of Guardians are going to seek the advice of the Local Government Board as to proceeding further with the new workhouse scheme in view of the report of the Poor Law Commission. Under imperative directions from the Whitehall authority, the guardians have had plans prepared, and completed other preliminaries to a scheme involving an expenditure of between 20,000*l.* or 30,000*l.*

IN his report on the health of Bacup during the past year, Dr. Brown, the medical officer of health, states that a much felt want in the town is about to be supplied, the Esther Estate, adjoining the cricket field, having been taken on which to build over 200 houses suitable for an artisan population. Each house is to have three bedrooms, &c., bathroom, hot and cold water, and front garden. He adds that there is every prospect that the houses will be let or bought as soon as they are ready for occupation.



THE committee of the Torquay Town Council to whom was referred the question of considering the new town hall and pavilion projects met last week, when the members were practically unanimous in regard to carrying out the two proposals simultaneously as a combined scheme. The suggested figures are 25,000*l.* for the town hall, and 20,000*l.* for the pavilion. The meeting was adjourned until March 30, a general desire being shown to take steps to carry out the combined scheme with all reasonable progress.

Two new and important works will probably be established in the Sutton district of St. Helens, Lancs., at an early date. Messrs. Morris & Bastert, of Loughborough), are negotiating for a site for an engineering works on a part of the Sherdley Estate, and it is said the works may eventually employ a very large number of workmen. The Junction Glassworks Company have sold their works which have been in operation for the past three years. The stock of rolled plate glass has been purchased by Messrs. Pilkington Brothers. The extensive buildings on the site are to be used as works for the development of a new method of making steel which was recently patented.

WE have just received an advance copy of the *Pall Mall Magazine* for April. It is an interesting number, well printed on good paper. There is something to suit each class of reader. A most interesting article is that on Sir Douglas Straight, the retiring editor of the *Pall Mall Gazette*, and one of the leading journalists of the day.

AT the annual dinner of the Gainsborough employés of the firm of Messrs. Newsum, Sons & Co., on Friday last, it was stated that the firm had recently accomplished a smart piece of work. On February 24 they took in hand a large order for Messina—to supply 1,000 windows, 500 doors and 625,000 feet of mouldings. This work had been completed in contract time, and on March 10 the consignment left Gainsborough in a special train of thirty-one waggons.

MR. WATT, M.P., asked in the House of Commons on Monday what firm had been engaged to do the measuring work at Rosyth, and where was their place of business? He also asked why measurers with their places of business in Scotland were not given the opportunity of this work, and would the authorities in future see that Scottish measurers got some share of the Admiralty's work in Scotland, seeing that they were more conversant with the methods of the various tradesmen there? The First Lord of the Admiralty in reply stated that Messrs. George Corderoy & Co., 21 Queen Anne's Gate, Westminster, had been engaged. It was considered the above firm had the largest experience of great engineering works. Scottish surveyors have been employed for building works in Scotland, and will be so employed in future.

HIGH PRESSURE OR LOW PRESSURE.

A CASE under the London Building Act was decided at the Mansion House police court on the 5th inst.

Mr. Frank Lee, a steam and hot water engineer carrying on business at 62 Chiswell Street, E.C., was summoned on the information of Mr. C. W. Surrey, district surveyor for the Western Division of the City, for making default in complying with a notice of an irregularity served on February 8.

The notice set out particulars of work done in contravention of the Act, and to be amended as follows:—"A pipe for conveying steam had been fixed nearer than 6 inches to combustible materials in contravention of sec. 66, sub-sec. 4 of the London Building Act, 1874."

Counsel raised a preliminary objection that the notice was bad inasmuch as no offence was shown, and contended that under sub-sec. 4 the words "not being a pipe for conveying steam at low pressure" should have been added.

Sir John Bell said he would take the evidence first as to whether the pipe was for high pressure or low pressure.

The Surveyor then gave evidence and stated that the pipe was a $\frac{3}{4}$ inch pipe leading from the basement, up the lift shaft into the kitchen, under the hot plate-rack, and returning to where the girls wash their dishes. If all the valves were open there was no doubt it was a low pressure pipe, but he was not prepared to say whether the pipe would be a high pressure one with the valves closed.

Sir John Bell, without calling upon the defence, decided that the summons must fail on the objections raised, and moreover expressed his opinion that the steam pipe was of low pressure, as it could only be used with the valves open, and that the proceedings were frivolous on the part of the surveyor.

AN intimation has been received by the town clerk of Brierley Hill (Mr. W. Waldron) that the Local Government Board have sanctioned a loan for the town's deep sewerage system. The amount involved is nearly 20,000*l*. By arrangement with the Kingswinford Rural Council the sewage is to be treated on the rural council's farm at Kinver, the price to be paid by Brierley Hill for this privilege being 750*l*. per year, for a period of thirty years from January next.

MUNICIPAL TRADING IN LIVERPOOL.

THE following correspondence has taken place between the Liverpool Master Builders' Association (a large majority of whose 450 members are Liverpool ratepayers), and the finance committee of the Corporation:—

Duchy Chambers, 24 Sir Thomas Street, Liverpool:
February 9, 1909.

Dear Sir,—The Council of this Association have had under consideration the question of the large amount of work that is executed by the Corporation through their own Works Department, and cannot help feeling that while in a large city like Liverpool the Corporation must of necessity employ a considerable number of workmen direct, at the same time a very large amount of work now done in that way might, with distinct advantage to the best interests of the ratepayers, be put out to competition.

A statement was made at the last meeting of the City Council to the effect that some work that had been done by the Works Department had cost from thirty to forty per cent. more than if it had been executed by a private contractor, after having been submitted to competition, and though my Council are not at present in a position to verify these figures in their entirety, they are convinced that they are substantially correct, and feel strongly, especially as far as work in the building trade is concerned, that a considerable amount of money might be saved every year in this way, and thereby tend towards preventing continual increase in the rates.

I shall feel obliged if you will kindly submit this letter to the consideration of your committee and look forward to hearing from you as to the result at your convenience. Thanking you in anticipation, yours faithfully,

BERTRAM B. MOSS,
Secretary of the Liverpool Master Builders' Association.

Mr. J. S. Harmood Banner, C.C., M.P., Chairman of the Finance Committee, Municipal Offices, Liverpool.

Town Clerk's Office, Municipal Buildings, Liverpool:
February 20, 1909.

Dear Sir.—I duly submitted to the meeting of the finance committee yesterday your letter of the 9th inst., with reference to placing out to competition work now done by the Works Department.

The committee did not, however, pass any resolution thereon.—Yours truly,

EDWARD R. PICKMERE, Town Clerk.

The Secretary, the Liverpool Master Builders' Association,
24 Sir Thomas Street, Liverpool.

Duchy Chambers, 24 Sir Thomas Street, Liverpool:
March 6, 1909.

Dear Sir,—Referring further to my letter of the 9th ulto. addressed to the Chairman of the finance committee, and your reply thereto of the 20th ulto., I am requested to write and inform you that my Council are very dissatisfied indeed with the way the finance committee have treated this Association's important suggestion.

My Council in writing to the finance committee thought that they were approaching the committee which could, if the suggestion met with its approval, bring influence to bear upon the spending committees, coupled with the suggestion of preventing as far as possible municipal trading being carried on to an excessive extent to the disadvantage of the ratepayers in general and the members of this Association in particular.

My Council cannot help feeling that the finance committee have practically ignored the communication from this Association containing a suggestion which, if acted upon, would save the ratepayers of Liverpool many thousands of pounds per annum.

My Council have instructed me to forward a copy of this correspondence to the chairmen of all the "spending committees," and anticipate that they will give the matter more serious consideration than the finance committee has seen its way to do.

I am also instructed to forward a copy of the correspondence to the local papers, which I am doing.—Yours faithfully,

BERTRAM B. MOSS, Secretary,

Mr. Edward R. Pickmere, Town Clerk,
Municipal Offices, Liverpool.

Are you interested in WOOD PRESERVATION?

ANTHROL protects all varieties of wood from decay, whether the situation be damp or dry, and from the ravages of all wood-destroying insects, including the white ant on shore and the teredo in sea water. Rats will not gnaw wood which has been treated with **ANTHROL.** Full particulars and prices will be sent on application.

ANTHROL

The result of much practical experiment has shown it to be the most efficient and economical means for preserving any variety of structural timber which it is impracticable or undesirable to have creosoted under pressure. **ANTHROL** does **not** require expensive pressure-plant; does **not** reduce the mechanical efficiency of the timber; does **not** increase the liability of the wood to inflame; does **not** render the wood poisonous to human beings or domestic animals; and does **not** leave the surface of the wood black and unpleasant for handling—on the contrary, **ANTHROL,** while protecting from decay, at the same time greatly improves the appearance of wood, and may be varnished or painted if desired.

The ANTHROL COMPANY, Kinning Park, GLASGOW;
and 6 Crosby Square, LONDON.

THE

Festiniog District Slate Quarry Proprietors' Association

THE Members constituting this Association, whose names are subjoined, beg to notify Architects and the trade that they are the producers of the genuine **Portmadoc Slates,** and would respectfully invite co-operation in discouraging the sale of other, and inferior, slates as such.

¶ The Members will be pleased to supply Acid, Water and Breakage Tests, with full Analysis; also a list of important Government and public buildings upon which their slates have been used during the past 100 years.

¶ Portmadoc Slates contain, according to analysis, only **1** per cent. of lime, whereas the imitation composite slates, now extensively advertised, show much variation; samples recently analysed contain upwards of **40** per cent. of this highly perishable subsiance, and are liable to an absorption of moisture **forty** times as great as that of Portmadoc Slates.

FIBRO-CEMENT *COCK BRAND* SHEETS

AND SLATES

Registered under No. 260,349, January 20, 1904.

PANELLING OF A DINING-ROOM.

The ceiling and panelling of this room, as well as the door casing, mouldings and door panels, are done with Fibrocement.

A panelling of this kind costs less with Fibrocement than if done with wood, as all glueing and assembling is replaced by a simple nailing and the superposition of sheets of various thicknesses.

Compared with wood panels, ours have the great advantage of never "playing" and never giving occasion to numerous joints of paint inevitable with wood panels. Fibrocement never rots. Once fixed to the wall, it in no way loses its shape.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

SAVE 50%
OF YOUR
COAL BILL
BY USING THE PATENT
"Bond" Stove
Recent Testimonial.
Chelmsford, 12th January, 1909.
DEAR SIRS,—I have very great pleasure in stating the "Bond" Stoves have given me entire satisfaction, and I have no hesitation in saying, that if I were purchasing stoves for a new house I should, with my present experience, have all the fireplaces fitted with them. Apart from the great heat generated, and thoroughly distributed about the room, they are most economical in coal consumption.—Yours very truly.
(Signed) WILLIAM F. GEPP.

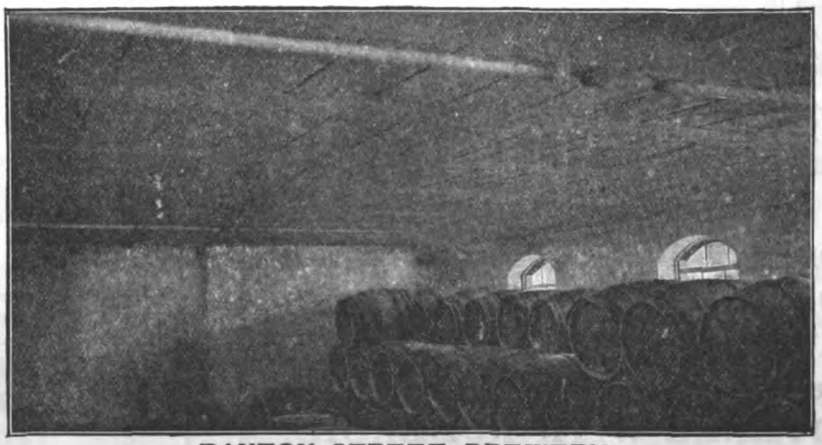
TRADE NOTES.

MESSRS. PATMAN & FOTHERINGHAM, LTD., have been successful in obtaining the contract for the extension and alterations at the Union Jack Club, Waterloo Road, S.E., under Mr. H. B. Measures, the architect.

THE new schools, Peterborough, are being ventilated by means of Shorland's patent exhaust roof and special inlet ventilators, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

THE Sussex Portland Cement Company, Ltd., Newhaven, have issued a second edition of their elegant calendars, giving the remaining nine months of the year. The sketch is of Calstock Viaduct, Cornwall, on which their Newhaven brand was exclusively used.



MESSRS. GEORGE MILLS & CO., LTD., fire engineers, Radcliffe, near Manchester, have just placed on the market a new chemical fire-extinguisher which has several features to recommend it. The acid is held in a porcelain jar, which makes it impossible that there should be any corrosion; there are no parts to be broken, and nothing is wanted for recharging but a supply of the ingredients. This machine is made in heavy rolled copper lined with tin, is highly polished and has brass rims top and bottom. Bearing in mind that all fires start from small beginnings, it is very desirable that all public buildings and institutions should be protected by an equipment of extinguishers.

MR. L. B. BARCLAY, engineer to the Water of Leith Purification Commission, in his annual report says he has been considering whether a less costly ventilating system could be introduced. "This, I think, could be brought about by using the lately discovered chemical known as thalassol (hermite solution), and which, I believe, can be manufactured at a trifling cost at either of the electric power stations in Edinburgh by payment of royalties. This chemical is spoken of as a most powerful deodorant, and I am of opinion that, if it were to get a fair trial by applying it to our existing apparatus, the cost of maintaining the present system could be reduced by 100*l.* per annum, if not more. On the other hand, I am of opinion that if something was done to keep down the temperature of hot liquids at present being discharged into the sewers from the different factories throughout the city, the generation of sewer gas in the sewers would be reduced to a minimum, and probably the Commissioners would be able to dispense with the present ventilating system to a considerable extent. This is a matter which might very well form the subject of a joint report by the burgh engineer and myself. I am satisfied that a large expenditure could be avoided if all hot liquids discharged into the city sewers were reduced to a temperature of 90 degrees. I would respectfully ask the Commissioners to consider the matter, and I shall be glad if I may be permitted to try an experiment with the use of thalassol." The report was adopted.

THE annual exhibition of students' work at the Borough Polytechnic Institute will take place to-morrow (Saturday). There are fourteen departments.

THE Essex education committee on Tuesday approved plans for a girls' school at Bishop Stortford, a high school to cost 13,000*l.* at Romford, and a new school at Earl's Colne.

THE Dumfries County Council have under consideration a considerable extension of the county buildings, so as to provide satisfactory accommodation for the sheriff and his staff, and also the county council and their staff of officials.

THE Yarmouth Board of Guardians have been informed that the Local Government Board will authorise the expenditure of 12,716*l.* for the extension of the infirmary. The work is to be proceeded with as soon as possible.

THE Concrete Institute have published the first number of their "Transactions and Notes." The notes chronicle the various activities of the Institute, and the papers read at the two first general meetings have been reprinted in full together with the verbatim discussion.

To meet the requirements of those employés of the London and South-Western Railway who, when the works at Nine Elms are removed to Eastleigh, will be unable to find accommodation at that centre, Messrs. Wilson, contractors, London, are immediately erecting 150 houses at Hampton Park, with bath-rooms and other modern accessories. They are prepared to go on building so long as such houses are required.

AT the last Partick Dean of Guild Court lining was granted to the trustees of Partick Congregational Church to erect a church at the corner of M'Lean Street and Stewartville Street. Sitting accommodation is to be provided for 550 persons, and about 180 in the hall. The estimated cost is 4,000*l.*

AN international competition has been arranged by the Lombard Co-operative Society of Public Works to determine types and methods of building to be adopted in those parts of Italy which are subject to earthquakes. Plans, reports, photographs and models will be received by March 31, and awards of 120*l.*, 80*l.*, and 40*l.* are offered for the best proposals. The secretary's address is 8 Via Lupetta, Milan.

THE Rotherham Rural District Council on Monday considered plans relating to a model village at Maltby, where mining and railway developments are proceeding. Besides providing for the erection of a number of houses, the scheme embraces football ground, cricket ground, tennis court, &c., in the form of a park. It was decided to endeavour to arrange for the straightening and widening of the road, which would no doubt be very much more used in the near future.

THE London County Council on Tuesday agreed:—"That application be made in the session of Parliament of 1909 for authority to enable the Council, notwithstanding the provisions of Section 27 of the Metropolitan Board of Works Loans Act, 1869, to defray, out of any surplus arising from the sale or transfer of property acquired for the purposes of the Works Department out of money raised by loan after paying off the amount of debt outstanding thereon, any deficit arising from the sale of plant, materials and other items, the purchase of which was defrayed out of advances from the general county account."

THE Dublin Corporation are to hold a special meeting to consider a letter from Mr. P. J. Kinlen, Greystones, contractor for the new reservoir, in course of construction, at Roundwood, asking the Corporation to sanction the transfer of the work to Messrs. M'Kee & M'Nally, contractors, of Dungannon. The work was commenced early last year. Mr. Kinlen asks that the necessary arrangements should be sanctioned as speedily as possible. Messrs. M'Kee & M'Nally are well-known Irish contractors, and are at present engaged in carrying out important water-supply works for the North

GREEK MARBLE.

Digitized by Google

and South Dublin Unions. The amount of the original contract for the reservoir at Roundwood was 87,000*l.*, and Mr. Kinlen has spent already 18,000*l.* upon the works.

MR. G. H. RILEY, surveyor to the Wellington Urban District Council, last week presented estimates of the cost of three different schemes for public baths. No. 1 provides for a covered swimming bath, 75 feet by 20 feet, with a depth ranging from 6 feet to 3 feet, together with five men's and five ladies' slipper baths, a shower bath, public wash-house, caretaker's house, &c., at a total cost of 3,000*l.* No. 2 scheme provides for a swimming bath (uncovered) on similar lines to the first, but without the public wash-house, &c., at an estimated cost of 1,450*l.*; and No. 3 scheme provides for an open swimming bath only, at a cost of 850*l.* The sanitary committee have been instructed to consider No. 1 scheme in detail.

THE Bath Historical Pageant to be held at Victoria Park, Bath, from July 19 till July 24 will comprise eight episodes with 3,000 performers. The covered auditorium will accommodate nearly 4,000 spectators. The episodes will be as follows:—(1) Roman market scene and dedication of the temple, about A.D. 160; (2) Sack of the Romano-British city of Bath by the West Saxons, A.D. 577; (3) Coronation of King Edgar, A.D. 973; (4) Visit of King Henry VII., and dream of Bishop Oliver King, A.D. 1499; (5) Visit of Queen Elizabeth and confirmation of the city's charter, A.D. 1590; (6) Battle of Lansdown and fall of Sir Bevil Grenville, A.D. 1643; (7) The glorious times of Beau Nash and Ralph Allen, 1752; (8) Reception of Queen Charlotte, 1817.

THE electricity and street lighting committee of Plymouth Corporation have declined to accept the challenge of the local Gas Company to a demonstration of the respective merits of the rival illuminants. The committee some months ago instructed their engineer to report what means could be advantageously adopted to demonstrate the effectiveness of electric light as an illuminant, and also to consider the suggestion that special arc lamps should be placed at a few prominent points in the centre of the town. The Gas Company thereupon suggested that arrangements should be made to demonstrate the efficiency and economy of gas as well as of electricity for street-lighting purposes. After two months' consideration the committee have decided to reply thanking the Gas Company for their letter, but inviting them to submit any suggestions they may have to make with regard to any improvement of the existing system of gas lighting.

MR. A. A. G. MALET, M.I.C.E., held an inquiry at Walsall last week, on behalf of the Local Government Board, as to a proposal by the Town Council to borrow 62,734*l.* for sewage disposal works. A scheme estimated to cost 78,550*l.* was prepared by the late borough surveyor, but Mr. Taylor, the present surveyor, amended it so as to cost 62,734*l.*, and that scheme had been submitted to the Local Government Board and approved. Since then, however, a further report had been issued by the Royal Commission on the matter, and, acting on what was laid down there, the scheme was amended so that it would cost only 50,000*l.* and would keep all the works within the borough instead of going partly into West Bromwich and Wednesbury. The loan asked for was therefore 50,000*l.*

A BUILDING workman who recently emigrated to America has sent an account of his experiences. In the course of it he says:—"I stayed fifteen months in Montreal, but left on account of a strike, and have been in Chicago since last June. I was on a large skyscraper, twenty-two storeys high, right from start to finish, but it only lasted fifteen weeks. The buildings simply grow up like mushrooms here. You can guess the size when I tell you there are 110 bathrooms in it. It is a sort of large boarding house for business people. We work on cable scaffolding, suspended from the steel frame work. The scaffolds are wound up by levers; there is never any reaching up. It was rather a weird feeling at first swinging up in the air about 250 feet high, and the style of work is so different. There are eighteen skyscrapers going up here this season, and trade will be good all over the States. Last year's buildings in Chicago, if placed side by side, would take up fifty-five miles of frontage. That is paper estimates and no Yankee yarn. There is only one bricklayers' hall in Chicago, and there were 9,000 brickies on the books last season, but that was because other parts were slack. There are 5,000 resident brickies, and that is a good number. We are now getting 65 cents an hour, eight hours a day, 8 A.M. to 5 P.M., 1*l.* 1*s.* 8*d.* a day, and it has to be zero before they stop bricklayers. We work with salamanders and canvas round scaffold."

ACCORDING to an estimate submitted to the management committee of the Glasgow Corporation Markets Department by Messrs. Alex. Knox & Robb, measurers, the probable cost of the proposed extension of the lairages and slaughter-house accommodation fronting Hill Street and Duke Street, as shown on the plan attached to the report by the joint deputation of the Corporation and the Glasgow United Fleshers' Society as to the inspection of markets and slaughter-houses on the Continent and in London, will be 65,000*l*. The committee approved of the proposed extension being proceeded with, except as regards that part which involves the demolition of the tenements fronting Duke Street and Hill Street, which is estimated to make the total cost 5,000*l*. less. The committee instructed the city engineer to proceed with the preparation of detailed working drawings, and, in conjunction with the measurers, of specifications, schedules of quantities, and forms of tender for the proposed extension, the town clerk to advertise for tenders for the work so soon as the Corporation have approved of the minutes.

IN the Official Referee's Court on Tuesday judgment was given by Mr. Muir Mackenzie in the action brought by Mr. Daniel T. Jackson, contractor, of Barking, against the Romford Rural Council, in respect of the contract for the construction of the Dagenham sewer and outfall works. The hearing lasted thirty-four days. The plaintiff's claim was for 10,750*l*. for work done; alternatively he claimed the same amount for the alleged exceptional and unreasonable manner in which he was compelled to execute certain works; as a further alternative, he claimed the same amount for damages for alleged false representations in the plans and drawings incorporated in the contract and in quantities, on all of which the plaintiff contracted, and by which the plaintiff said he was compelled to execute more costly work than was represented to be required. The Rural Council denied the claim, and counter-claimed for damages because the work was not executed in a certain time. The learned Official Referee found that the plaintiff did complete the work in accordance with the specifications and sections as varied by the defendants' orders, and therefore the defence of non-completion failed. He granted judgment for the plaintiff for 3,432*l*. 15*s*. 8½*d*. damages, and said that the plaintiff had succeeded on one issue, but failed on two, and a set-off of costs was inconvenient; he should allow him three-quarters of the costs. The counter-claim was dismissed.

FOR visiting Holland and Germany during the Easter holidays the Great Eastern Railway Company's British Royal Mail Hook of Holland route offers exceptional facilities. Passengers leaving London in the evening and the Northern and Midland Counties in the afternoon arrive at the chief Dutch cities the following morning. A corridor train with dining and breakfast cars is run on the Hook of Holland service between London and Harwich. From the Hook of Holland through carriages and restaurant cars run in the North and South German express trains to Cologne, Bale and Berlin, reaching Cologne at noon, Bale and Berlin in the evening. Special tickets at reduced fares have been arranged by the Harwich-Antwerp route for passengers wishing to visit Brussels for the Field of Waterloo. For the convenience of passengers, tickets dated in advance can be obtained at the Liverpool Street Station Continental inquiry or booking offices.

BEAM compasses of a novel pattern have been introduced by Mr. W. H. Harling, mathematical drawing and surveying instrument manufacturer, of 47 Finsbury Pavement, E.C. The beam is wedge-shaped, so greatly assists the firm attachment of the compasses. The slider is ready clamped in any position without the use of a screw, which is liable to wear out, and it is adjusted by thumb pressure. Each set includes two beams, one of 10 inches and the other 30 inches. The compasses with the shorter of the two will be found in practice to be an excellent substitute for a pair of 6-inch compasses, as it is perfectly rigid and the points are always perpendicular to the paper. Extra lengths of beam may be obtained at a small cost from the manufacturer, or they can be made by any carpenter. When the compasses are required for use in different offices, the beams can be supplied in short lengths, which can be joined by means of a double clamp. The points are fastened by clamping screws instead of the usual set screws. The new idea is called Philpot's Patent Beam Compasses.

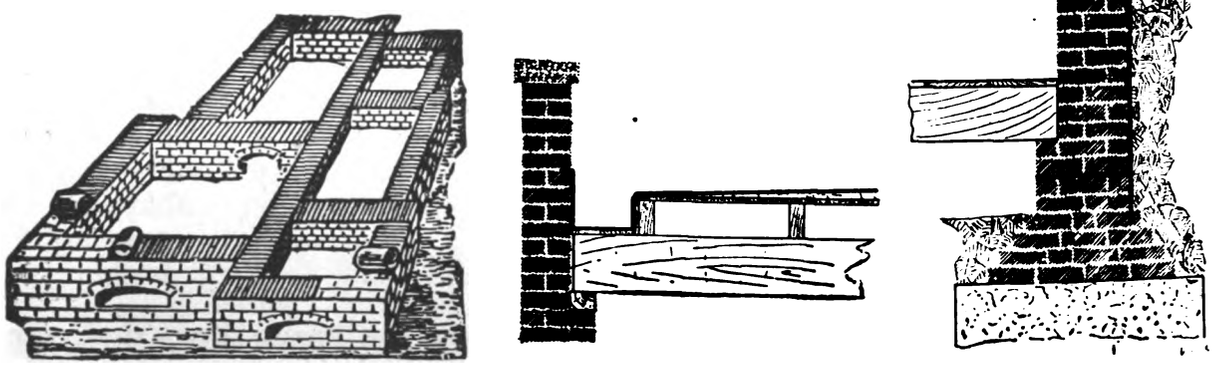
REINFORCED BRICKWORK TEST.

WE recently gave a brief general description of "Monolithic Brickwork"—*i.e.* brickwork with a reinforcement of steel wire mesh 2 inches or 2½ inches in width with four tensional wires running its extreme length. The tests here illustrated were carried out on a piece of brick wall 3 feet high forming

a 5 feet cantilever built as follows:—A 4½-inch outer wall, a cavity 1½ inch, and an inner 3-inch wall. The joints were reinforced in every course on the H B system, this reinforcement being carried throughout the entire length of the walls and piers. There were no ties between the inner and outer walls. The distributed load of pig iron left on the span after the first day's test was 5,040 lb. Next day it was increased to 8,260 lb. without any indication of deflection, and finally to 10,640 lb., when it broke suddenly without showing any tendency to crack or deflect.

An examination of the fracture showed that the bricks, where built into the pier, had sheared across, and the others had broken away at the joint. The wire reinforcement thus bore the tension strain of the load of 10,640 lb. Finally, the bricks of the cantilever wall gave way under excessive shearing force, the wire reinforcement being likewise cut across.



This remarkable result shows that the method of reinforcement is valuable and will permit of openings in brick walls being constructed of wide spans without the use of girders or arches to support the brickwork. This method of

SHEET LEAD as an effective and for **"ALL TIME" Damp Course** cannot be surpassed.

HOFLER'S DAMP COURSE

consists of a continuous sheet of lead foil, protected between two layers of fibrous asphalte sheeting.

Made in all wall widths, and up to 39 inches wide. In rolls 66 feet long, without a joint, it may consequently be specified with confidence.

construction is new in England, but similar ones have been known in Germany for several years, and the system of Messrs. Rd. Johnson, Clapham & Morris is quite equal to the best German one that we have seen.

AN L.C.C. MAIN DRAINAGE CONTRACT.

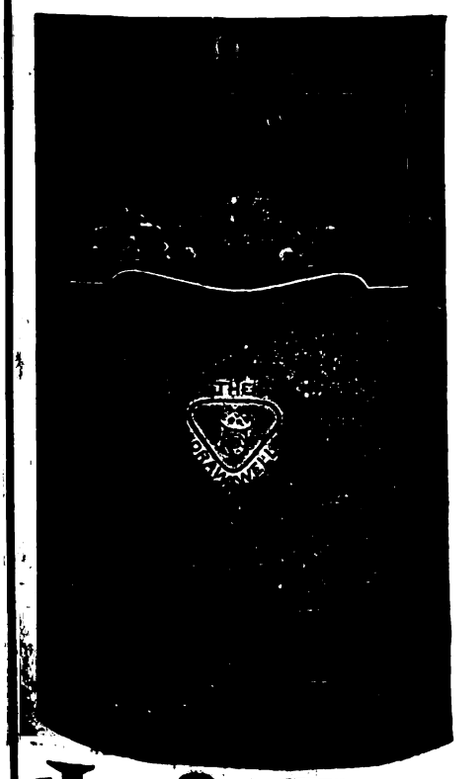
THE London County Council on December 15, 1908, referred to the main drainage committee the undermentioned tenders for the construction of section 5 of the northern low-level sewer No. 2 between Grosvenor Crescent and Warwick Road, Kensington:—

A. N. Coles, Westbourne Park	£164,810 1 0
John Cochrane & Sons, Westminster	187,937 4 2
S. Pearson & Son, Ltd., Westminster	188,580 16 0
J. Mowlem & Co., Ltd., Westminster	189,712 0 0
G. Shellabear & Son, Plymouth	189,954 4 5
Kelletts, Ltd., Holborn	191,413 9 5

On December 22 the committee reported that it would be to the Council's advantage to obtain fresh tenders for the work. The Council, however, did not accept this recommendation and passed the following resolution:—"That the recommendation be referred back to the committee, with instructions to accept, on behalf of the Council, during the ensuing recess, the lowest of the tenders received for the construction of section 5 of the northern low-level sewer No. 2, on condition that the tenderer agrees to give preference in employment on casual or unskilled labour required for the work to men bona fide resident in the county of London, and that particulars of such tender and of the remaining tenders be subsequently reported to the Council."

In accordance with the foregoing instruction the main drainage committee accepted, on January 7, 1909, the tender submitted by Mr. A. N. Coles, subject to the conditions referred to in the Council's resolution. Mr. Coles at first refused to give the undertaking which the Council required with reference to the employment of London labour, but, as a result of further correspondence, he agreed to meet the Council's wishes in this respect on condition that he was allowed to make certain alterations in the schedule of prices contained in his tender. This course was not permitted, and on February 9, 1909, the Council decided to invite fresh tenders for the work.

The new tenders, which contained a clause providing that preference in employment on casual or unskilled labour required for the work should be given to men bona fide resident in the county of London, were as follows:—



The Westminster Construction Company, Ltd., Westminster	£172,630 12 6
W. Muirhead & Co., Westminster	174,998 11 2
H. M. Nowell, Stockton-on-Tees	175,852 2 6
J. Mowlem & Co., Ltd., Westminster	177,782 0 0
John Cochrane & Sons, Westminster	182,698 6 2
S. Pearson & Son, Ltd., Westminster	183,147 18 6
G. Shellabear & Son, Plymouth	185,433 13 5
H. Kellett, Ealing	186,070 18 5
E. Bentley & Son, Leicester	187,453 12 3
Johnson & Langley, Leicester	198,667 11 6
Walter Scott & Middleton, Ltd., Westminster	205,437 0 0
Price & Reeves	207,036 16 11

The chief engineer's estimate comparable with the tenders is 172,750*l.*

The main drainage committee recommend that the tender of the Westminster Construction Company, Ltd., should be accepted. Also that an expenditure on capital account not exceeding 4,500*l.* be sanctioned for general incidental expenses, including the employment of resident and assistant engineers, clerks of works and inspectors required in connection with the supervision of the work referred to in the foregoing resolution.

THE Local Government Board has sanctioned a loan of 8,500*l.* for the erection of a new kursaal and pump-room at Matlock Bath. The total cost of the scheme will be over 30,000*l.* Building is to be commenced at once. The kursaal will occupy the best site in the town, and include a restaurant to seat 1,000, a roller-skating floor, a ballroom, a concert or theatre hall. Mr. F. W. Ackland Hodge, of 101 Gower Street, London, and Mr. Jno. Nuttall, of Matlock, are the joint architects for the scheme.

THE "DRAWWELL" GRATE

WAS PLACED

First in the Final Tests

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjunction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public and private buildings.

N.B.—All Grates bear the Trade Mark and Name of "Drawwell" on firebrick to insure against imitation.

This Grate can only be supplied through Builders' Merchants, Ironmongers, &c., but Drawings and Particulars can be obtained from

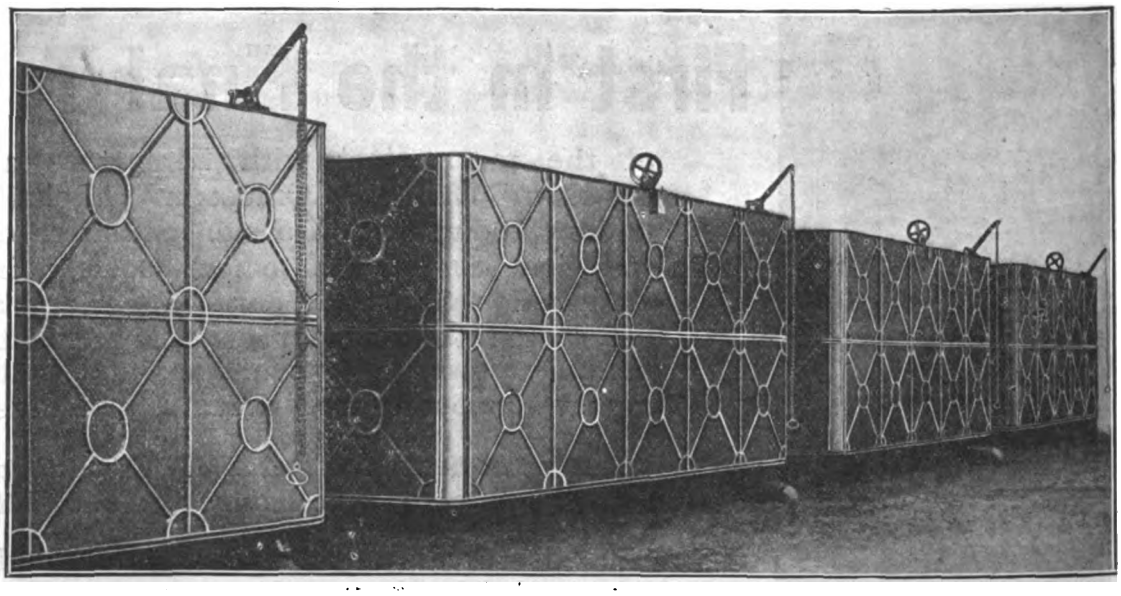
THE "AERO" FIRE ALARM.

ANYONE about to instal a fire alarm in any premises and who is studying the various systems available should not omit to investigate the claims of the "Aero" alarm. This can best be done in the case of a London architect or engineer by a visit to 92 Queen Victoria Street, E.C., the central office of the Aero Fire Alarm, Ltd. Installations are also in use in some of the chief provincial cities as well as in various country mansions.



The alarm is remarkable for its simplicity. It consists of a wire-covered copper tube, one-tenth of an inch in outside diameter, which is run round the ceiling of the rooms of a building, and may be concealed from sight. It is carried through walls, or from floor to floor like an electric wire. Both ends of the tube go to an indicator board, where one is joined to the flat circular detector-chamber. One side of this chamber is made of a thin flexible disc, above which are two contacts, so that if the air pressure in the tube causes the disc to bulge, these contacts are brought together and close an electrical circuit. Near the detector-chamber is a "leak," connecting the tube with the outer air. This is closed more or less tightly, according to requirements, by a porous washer and an adjusting screw. The other end of the tube is joined to a testing pump with a push button and hand-wheel. The "leak" allows the air pressure inside the copper tube to fluctuate with the external atmosphere. When the temperature of a room is raised for working purposes by stoves, radiators, pipes or other means the increase is gradual and slow, and consequently the gradually expanding air inside the tube makes its escape through the "leak" and does not affect the flexible disc. In the event of an outbreak of fire, however, the increase is so rapid that the air has not time to escape before affecting the disc, which expands, an electrical circuit is made, and the alarm immediately sounds.

In the case of an independent installation such as would be put up in a country house, the alarm could be simultaneously raised on various parts of the building, in the stables, in the lodge, and in any other place where help would be forthcoming. In certain provincial towns there is a direct connection from the premises so protected to the fire station. The London County Council will not allow such a connection, so that a central office has been established at 92 Queen Victoria Street, which is in automatic communication with the various installations throughout London. If, for instance, a fire was to break out in the new Selfridge's Stores (one of the large buildings equipped with the "Aero" system), the alarm would be raised simultaneously at those premises and at Queen Victoria Street, where the signal would be transmitted to the fire brigade. Elaborate precautions are taken against any chance breakdown in the signal, and it would seem as if no failure were possible.

One striking feature of the alarm is its adaptability to different requirements, thanks to the "leak" with its adjusting screw, and to the variable distance between the disc and the two contacts. By these means an increased or a decreased susceptibility may be arranged as desired. Another feature is the simplicity and thoroughness of the tests which are made merely by operating the air-pump of the testing chamber; this creates a sudden momentary increase of air-pressure in the tube, similar to what happens on an outbreak of fire, and the alarm therefore is sounded in the same way. A third recommendation is its invisibility. The small tubing can be hidden in the cornice, or even carried under the plaster out of sight. This advantage must commend itself to those who are anxious not to spoil architectural effect by unsightly wires or thermostats. Finally, the system is approved by the fire offices committee, and insurance companies allow the maximum rebate where it is installed.

THE plans for the new slaughter-houses of the Edinburgh Corporation at Gorgie were passed by the Edinburgh Dean of Guild Court last week. The buildings are to be constructed chiefly of brick, with ferro-concrete roofs, with the exception of the lairages, which are intended to be of corrugated iron. The interior walls are to be tiled, with the exception of the refreshment rooms, while an overhead tracking for the conveyance of carcases is to be erected. Estimates have been accepted involving an outlay of 30,000*l*. The work has been begun, the contracts having been let to Messrs. James Kinnear, Sons & Co. It is expected they will complete their part of the work early next year. The plans were prepared by Mr. J. A. Williamson, city architect.

DAM CONSTRUCTION IN NEW SOUTH WALES.

AT the ordinary meeting of the Institution of Civil Engineers on March 9, Mr. James C. Inglis, president, in the chair, a paper was read on "Concrete and Masonry Dam Construction in New South Wales" by Mr. L. A. B. Wade, M.Inst.C.E. The following is an abstract:—

In thirteen cases concrete walls curved in plan have been built for the storage of town water-supplies, the resistance of the material in the wall and the sides of the valley being relied upon for stability, and complex questions of stresses being disregarded. The formula used for determining the thickness of a wall at any level below the highest water-surface was

$$T = \frac{RP}{S},$$

in which T denotes the thickness at any level in feet; R, the radius in feet; P, the water-pressure in tons per square foot; S, the stress in tons per square foot. These vary as under for different materials, where D is the depth of water in feet:—$T = RD \times 0.0014$ when S is equal to 20 tons; $T = RD \times 0.0018$ when S is equal to 15 tons; $T = RD \times 0.0023$ when S is equal to 12 tons; $T = RD \times 0.0027$ when S is equal to 10 tons.

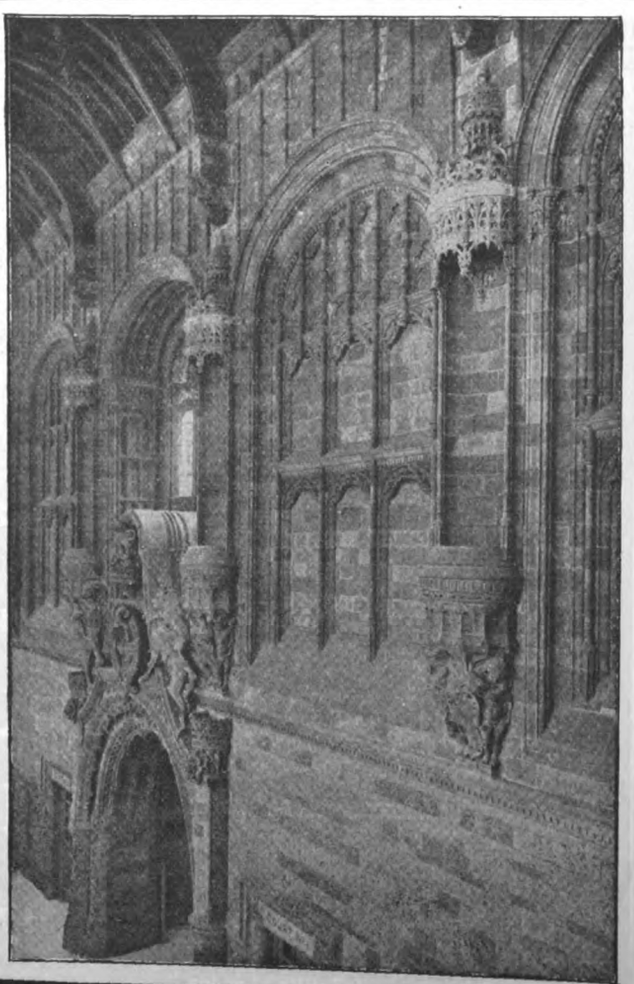
The cross-section would be a triangle, but in practice it is advisable to make the top not less than 3 feet 6 inches wide, increased according to the depth of water and the timber passing over in flood-time. The climatic conditions are against the formation of heavy ice.

Nine of the thirteen walls are curved for the whole of their length; of the rest, the Cootamandra has two tangents of gravity cross-section, and the Tamworth, Parkes and Woolongong walls each have one tangent of gravity cross-section. In all cases they abut against the rock sides of the gorges to their top levels. The gravity tangent at Parkes is constructed on a flat bench of rock at a level about 13 feet below the top of the wall, the thrust of the arched length being taken by the gravity length, assisted by an anchorage of steel rails placed vertically and connecting the wall to the rock foundation.

The horns of the curve are more or less fixed by local conditions, and a radius giving a versed sine of about one-third forms the most economical location between those points. When this rule will not apply, the radius may be advantageously altered to suit the configuration of the valley.

In two cases pressures of 24 and 25 tons per square foot have been allowed on hard granite, but later these limits have been reduced to 20 tons. Hard slate, sandstones, conglomerates and ironstones are limited to 15 or 12 tons per square foot, according to quality, and softer sandstones to 10 tons. These limiting pressures apply to the walls rather than the abutments, as the end of the wall can be splayed, thus reducing the pressure per unit area in the abutments. The walls in all cases are of Portland-cement concrete, with plums of greater resistance than the concrete, which is therefore the measure of the crushing resistance of the wall. The proportions of the concrete in all cases are 11½ cubic feet of sand, 10 cubic feet of shivers from ¾-inch to ⅛-inch gauge, and 13 cubic feet of metal of 1½-inch gauge. The results of tests of concrete gave a mean crushing resistance of 50 tons per square foot when mixed with soft sandstone and 100 tons with sound igneous rocks. It has been assumed that concrete in bulk offers a crushing resistance 1½ times greater than that of unsupported 6-inch cubes. The maximum pressures allowed on different materials give a factor of safety of 5 on results from unsupported 6-inch cubes, which, if the assumption of increased strength be correct, will be 7½ for concrete in bulk.

The section of a wall of 500 feet radius to resist 20 tons per square foot and of a wall of 270 feet radius to resist 10 tons per square foot closely approximates to that of a gravity wall for a similar depth of water. The author is of opinion that gravity walls should be made straight, a curve having no advantage as regards strength or adaptability to meet contraction sufficient to justify the increased quantities. The economical limit justifying substitution of curved for gravity walls is with radii somewhat less than the foregoing, bearing in mind the greater length of a curved as compared with a straight wall; thus the use of curved walls is restricted to comparatively narrow valleys and gorges.



Igneous rocks as foundations proved the most impervious media against leakage. In the case of granite, all soft seams were followed up. In sandstones and conglomerates, the

weaknesses were found along horizontal beds, and in cases leakage occurred under the flanks of walls, water entering some distance up-stream, the exit being some distance down-stream. In two instances short drives were carried under the flank of a wall to cut out weak places, being filled again with concrete and grouted through drill-holes under pressure. The worst leakages have been experienced in shale and slate.

The proportions of material used in concrete are sufficient for the required resistance at a minimum cost, but are not sufficiently impervious for a thin wall. In earlier walls a 6-inch facing of special concrete was placed on the up-stream side for watertightness. Subsequently it was found that by working the sloppy concrete in situ against the mould boards a skin was formed on the surface and a practically impervious wall was obtained. When, however, surplus water dried out, vertical cracks developed. Further experience showed that longitudinal contraction was less in a wall of concrete placed in situ fairly dry and well rammed, and that cracks either do not occur or occur only to a much less extent; but a skin could not be obtained and thin walls leaked excessively. It was found that two coats of neat cement applied as the timber was stripped gave good results and did not scale, owing to the absence of frosts.

Cracks have appeared more or less in the Parkes, Cootamundra, Tamworth, Wellington and Mudgee dams, but no failures have resulted. No cracks have appeared in any of the other dams.

The cracks in the Mudgee dam are more open than are those in dams constructed of dry concrete. Vertical cracks in all cases twist in their course, inwardly as well as vertically, and open and close with change of temperature; they almost disappear with high temperature and low water-level and cold temperature and high water-level, and open most with cold temperature and low water-level. They occur as a rule at quick changes of foundation level.

The author is of opinion that such vertical cracks, as they occur naturally, do not endanger the stability of the walls; but as they are likely to develop, it is better to provide parting joints to allow of the cracks forming on radial lines, spaced at intervals, than to allow them to occur naturally. Iron built horizontally into the top levels of walls has been suggested to prevent vertical cracks, but the author thinks this would lead to horizontal cracks. Iron might be built in if the parting joints were provided and if it did not cross the joints.

In the opinion of the author the experience gained of these structures since the first was completed in 1895 shows that curved walls relying for their stability on their resistance to crushing form a safe and economical means of storing large bodies of water.

Cataract Dam for Sydney Water-supply.—This dam is straight in plan and will retain about 21,500,000,000 gallons of water, covering an area of 2,400 acres. The dimensions are:—Length of wall, 811 feet; height above river-bed, 157 feet; depth below river-bed, 35 feet; total height (base to top), 192 feet; top width, 16½ feet; bottom width, 158 feet; maximum depth of water stored, 150 feet; length of spillway weir, 715 feet.

The highest estimated flood-level is 4 feet 6 inches over the spillway weir.

The material of which the dam is constructed is local Hawkesbury sandstone, and its maximum crushing-stress was limited to 8½ tons per square foot. A system of 6-inch rectangular conduits filled with broken stone, parallel to and about 6 feet back from up-stream face, was constructed to drain the interior of the wall, and these conduits were again drawn into 6-inch earthenware pipes laid at right angles to the wall, with exits on the down-stream face.

The sandstone, from experiments, gave a crushing strength of 276.3 tons per square foot on 12-inch cubes, unsupported.

Tests on concrete at ninety days gave an average of 113.5 tons, and mortar, for hearting, about 102 tons per square foot.

The remainder of the paper dealt with the construction of this dam.

AT the last meeting of the Stirling Town Council the burgh surveyor presented a report on the cost of erecting new municipal buildings on the site of the present ones. Including the purchase of property between Union Street and Spittal Street, the total cost of the buildings would be 12,931*l.*, and without this property the estimated cost would be 9,071*l.* The report was read and the matters continued for further consideration.

H. & C. Wrought Steel "Louvre" Ventilators

Black Japanned,
White Japanned,
Nickel Plated,
Bronze Plated.
ALSO IN
Solid Wrought Brass
and Bronze Metal.

ELEGANCE. LOW PRICE. NO BREAKAGE.
SPECIFIED BY ARCHITECTS.

MADE IN 130 SIZES.
From 4 by 6 to 24 by 42.

Each Ventilator is packed in a separate cardboard box, and is furnished with one brass pulley (no cord or tassels).

These Ventilators being made entirely of **Wrought Steel,** breakage either in transportation, in stock or in use, is practically impossible.

They are light in weight, with a consequent **Saving in Carriage.**

The Operating Slide is made of very heavy gauge steel, and is especially **strong** to insure against breakage and guaranteeing a free and positive operation.

Each Ventilator is packed in a separate cardboard box, and is furnished with one brass Pulley (no cord or tassels).

Sold by all First-class Builders' Merchants.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

NOTICE.

Next Friday being Good Friday, THE ARCHITECT *will be published on Thursday. All advertisements intended for this Number must reach the Office not later than* 4 P.M. *on Wednesday, April* 7.

No alteration of advertisement copy can be allowed after Saturday morning, April 8.

THE Plymouth borough surveyor has been instructed to prepare plans, specifications and estimate for the construction of stables and cartsheds near the refuse-destructor at Prince Rock, with a view of transferring the stabling, &c., from Phœnix Wharf. In 1905 the surveyor prepared an estimate for stables and cartsheds at Prince Rock, to cost 6,740*l*.

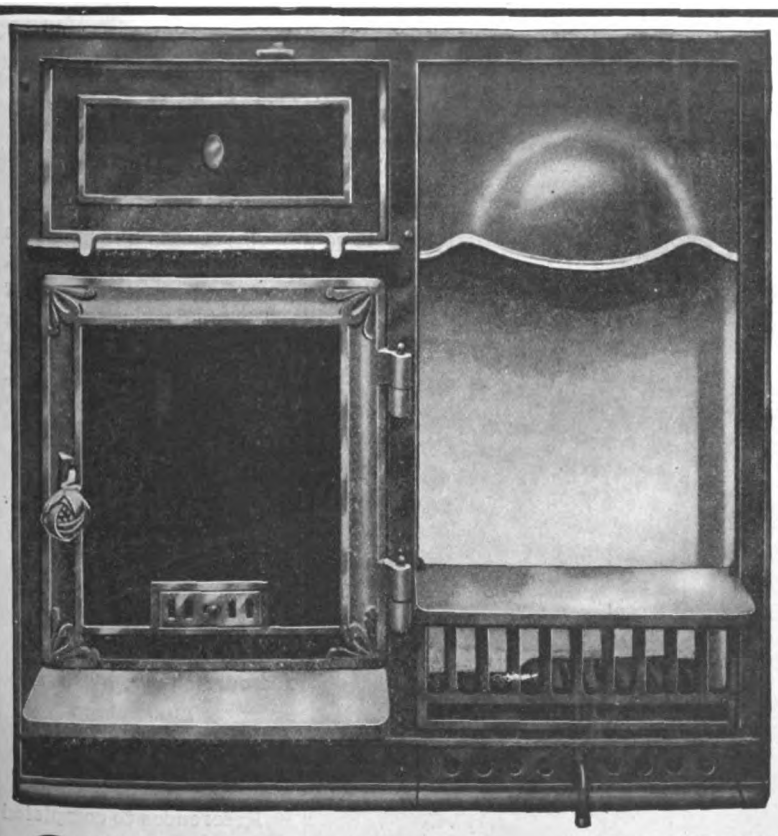
BUILDING AND BUILDERS.

The Coventry public works committee recommended that paving works be carried out at a cost of 16,607*l*., the greater part of which will be spent on granite setts.

Important structural changes at Aintree racecourse, near Liverpool, will be taken in hand almost immediately. It is intended to increase the size of the stand attached to the "Tattersall's" enclosure to accommodate about 1,000 additional spectators, and the capacity of the County Stand will also be considerably enlarged.

A new Free church is to be erected at Partick, N.B. Plans have been prepared by Mr. Petrie, architect, Wellington Street, Glasgow, and approved by the buildings committee in Edinburgh. Estimates for the work of erection have been received by the Deacons' Court, and it is expected that the work will be commenced very early in the month of April.

The Under-Secretary to the Home Department recently in the House of Commons gave the following figures of the Scottish output of granite during the ten years from 1898 to 1907:—1898, 440,513 tons; 1899, 445,753 tons; 1900, 416,221 tons; 1901, 434,015 tons; 1902, 451,808 tons; 1903, 440,534 tons; 1904, 451,095 tons; 1905, 404,688 tons; 1906, 382,155 tons; 1907, 357,966 tons.



The annual meeting of the Norwich and District Master Builders' Association took place at Victoria Chambers, the President (Mr. W. Stacey Daws) in the chair. The report was unanimously adopted, and the following officials were elected for the ensuing year:—Chairman, Mr. B. E. Scarles; Vice-Chairman, Mr. W. G. Crotch; Treasurer, Mr. J. S. Smith; Secretary, Mr. J. H. Hatch.

The Royalty Skating Rink Company, Chester, has entered into a contract with the Portable Building Company, of Manchester, for the erection of the new roller-skating rink, adjoining the Royalty Theatre, Chester. The workmen are already clearing away the old buildings from the site, and the building will be ready for opening about the first week in May. Mr. William T. Lockwood, F.R.I.B.A., is the architect.

Sir Henry Randall's building scheme for the development of the Wellingborough Road district of Northampton is approaching fruition. A contract of nearly 5,000*l*. has been entered into with Mr. W. Higgins, of Northampton, for the construction of twenty-four houses and a shop and a new street, which is a continuation of Percy Road. There remains under consideration the building of houses on the Wellingborough Road. Mr. W. D. Gibbins is the architect and surveyor.

The Secretary of the South Shields education committee presented a report on Monday showing the approximate cost of providing additional school places, in consequence of the existing accommodation being reduced by the recent action of the Board of Education in requiring that in infants' schools places are to be calculated on the basis of 9 square feet of floor space per child, and in boys' and girls' schools on the basis of 10 square feet of floor space per child. The report estimated the cost of carrying out the necessary additions to be 12,000*l*. A protest is to be sent to the Board of Education.

The twenty-fifth annual general meeting of the Institute of Builders was held at 31 and 32 Bedford Street, Strand, W.C., on Thursday, the 25th ult. The annual report was submitted, and the audited accounts and balance sheet for 1908 were adopted. The following officers were elected:—President, Mr. W. F. Wallis, J.P. (Maidstone); vice-president, Mr. R. W. Neill, J.P. (Birmingham); treasurer, Mr. W. Shepherd (London); hon. auditor, Mr. F. N. Cowlin (Bristol); executive council, Mr. E. J. Strange (Tunbridge Wells), Mr. Ernest J. Brown (London), Mr. G. Bird Godson (London), Mr. Wr. Lawrence, jun. (Waltham Cross). A hearty vote of thanks was passed to Mr. J. Carmichael, J.P., for his able occupancy of the presidency during the past year.

"SIGNET"
(No. 2)
Combined
Range & Register

Very suitable for Small Houses, Country Cottages, Flats, &c., where the same apartment is used as Kitchen and Sitting Room.

Combines in itself in a **practical** and **efficient** manner the essential features of a Cooking Range and a Sitting Room Grate.

Fitted with Patent Adjustable Damper, giving effectual control of chimney draught and economy of fuel—**an important feature.**

GOES INTO AN ORDINARY SITTING ROOM FIREPLACE.

Supplied in a variety of forms.

Large numbers in use throughout England and Wales, in Garden Cities and elsewhere, and giving universal satisfaction. Numerous unsolicited and enthusiastic testimonials received, copies of which, with full details of the grate, will be forwarded on application.

The Grate itself can only be supplied through Builders' Merchants, Ironmongers, &c.

TRADE NOTES.

UNDER the direction of Mr. E. Maples Linton, architect, Newport, Mon., the "Boyle" system of natural ventilation, embracing the latest patent air-pump ventilators, has been applied to the Malpas schools, Malpas.

No. 20 OLD CAVENDISH STREET (the new building is included among our illustrations) has been occupied by John Soper, window blind manufacturer, for over forty years—having been established there by the father of the present proprietor in 1867. A special feature of their business is the carrying out of architects' special designs. All kinds of window blinds, both for inside and outside use, are made on the premises. One of their patents is a lever-action pulley for Venetian and other blinds which obviates the use of hooks for fastening the cords.

THE "Turk System" for the hygienic drying of new buildings is rapidly spreading itself all over the country, and Messrs. Setzer & Co., Manchester, are ready to consider any further applications for licences. It is equally applicable to buildings both great and small, whether it be to Manchester Infirmary, Chelsea Town Hall, a bank, warehouse, or villa. These possess the same need for quick drying in view of immediate use. The Turk system draws the moisture out as an orange is sucked of its juice. Its efficacy has caused its adoption by a large number of architects in London and the provinces.

MESSRS. HALL & PICKLES, iron and steel merchants, Manchester, have issued a (waistcoat) pocket catalogue and 1909 notebook for the benefit of architects, builders, &c., when selecting steelwork, and the booklet should prove extremely useful. It contains a large amount of data as to the sizes and weights of some of their stock. Wherever necessary the code word is also given so as to facilitate ordering by telegram. The pocket-book includes numerous tables, e.g., of safe distributed loads in tons for compound girders of various spans, built up from stock, and of safe dead loads in tons for compound sections when used as stanchions for various lengths.

IT is common knowledge that ozone, *i.e.*, intensely strong oxygen, acts as a powerful agent for the purification of the air from waste organic matter. These properties are now used for the purification of domestic drinking water. During the past three or four years fourteen towns have followed the lead of Nice and installed the necessary plant for carrying out the "Otto" process of sterilisation by means of ozone for the town supply. The Lahmeyer Electrical Company, Ltd., New Oxford Street, W.C., have patented and brought out an apparatus on identical principles for the ozonisation by electricity of drinking water. It can easily be fitted to any tap or main and renders the absolute germinisation of drinking water possible. Only one ozone producer is necessary in a house, as all the taps may be connected to it. The apparatus consists of an aluminium plate and a metal-lined glass plate, between which the electric rays pass. As these rays only commence to pass at higher electrical pressures, a small transformer converts the supply to the higher voltage. The two are self-contained in a covered case. The instant the water tap is turned on an automatic membrane contact switches the transformer into circuit, the high pressure terminals of which are connected to both plates of the ozone producing apparatus. Between these plates violet rays commence to pass which convert the ordinary oxygen of the surrounding atmosphere into ozone. The ozone thus formed is drawn from the producer through a thin metal tube into a special emulser screwed on to the tap, in which the ozone and the water mix. Searching tests with artificially contaminated water have proved that the treatment with ozone freed it from all bacilli. Science has once more been brought to bear on a very homely question and has achieved highly successful results. The filter is attached to the wall and is scarcely conspicuous.

THE Dundee Works Department have resolved to introduce electricity for ringing the curfew and morning call from the Old Steeple. The annual cost is estimated at 3*l.* and the initial cost at 25*l.*

IN order to provide for a constant supply of water to the main pumping-house and pressure cylinders in the South Yard, Devonport, for fire extinguishing purposes, it has been decided to substitute salt for fresh water. The supply will be obtained from the sea through 18-inch iron pipes.

A NEW SLIDE RULE.

THE accompanying illustration shows a co-ordinate spiral slide rule which has been invented by Mr. H. O. Barnard, A.C.H., F.R.A.S., &c., who is superintendent of the trigonometrical surveys undertaken by the Ceylon Survey Department. It is intended for the use of civil engineers and surveyors. Mr. Barnard thus describes its utility:—

"Like Professor Fuller's rule, it enables the user to perform, with speed and accuracy, arithmetical computations involving multiplication, division, proportion, continuous

fractions, powers, roots and logarithms; but, in addition, the natural and logarithmic values of trigonometrical functions of any angle can be determined by inspection with the same accuracy as in numerical computation, while the products, quotients, &c., of these functions by lengths or numbers, integral or fractional, are obtained with equal ease, rapidity and precision."

The pamphlet of instructions is minute in its directions and extends to nearly fifty pages. This labour-saving device has been introduced by W. F. Stanley & Co., Ltd., Great Turnstile, Holborn, W.C.

THE Budleigh Salterton District Council have decided (says *Truth*) to extend their sewer outfall further out to sea, and it was announced last week that they intend to rely on the contractor's promise to charge a fair price, so no estimate has been required. It is something quite new to hear of such work being undertaken for a public body without anyone having the slightest idea of its cost. If there is no contract any sum may be charged, and such slip-slop arrangements will certainly involve the unfortunate ratepayers of the town in heavy expenses, putting aside the probability of the matter ending in the Law Courts. Surely the Local Government Board has power to prevent such astonishing fatuity as is proposed.

VARIETIES.

THE staff of the Works Department at Chatham Dockyard is to be disbanded owing to no new buildings or other works being proposed.

THE Town Council of Bedford have resolved to apply for sanction of a loan for 14,455*l*., to defray the cost of a refuse destructor.

THE "combine" of Scottish makers of steel hoops and narrow strips has been dissolved owing to some firms having adopted methods to secure orders which were not in accord with the official understanding of the associated makers.

A SKATING rink is to be erected at Southend-on-Sea, on an excellent site in the centre of the town, within one minute of both railway stations, and with the trams passing the main entrance. The rink will be 180 feet by 80 feet, with a spacious promenade all round. Shops are to be erected on part of the site. The scheme is estimated to cost 7,000*l*., and plans have been prepared by Messrs. Cabuche & Hayward, of Queens' House, Westcliff, and 18 Eldon Street, E.C.

THE Mansion House Council on Dwellings of the Poor recently took out summonses against the owner of premises at Stepney, and as a result costs were awarded the Mansion House Council, and an abatement order was made. The Mansion House Council informed the Local Government Board that they felt that the condition of things was most undesirable, and they asked the Board to hold an inquiry as to the sanitary condition of the borough of Stepney. The public health committee of the borough council, to whom the matter was referred, report that they are quite satisfied that there is a complete answer to the charges made in respect of the premises in question. They court the fullest inquiry into the matter, and agree that the Local Government Board should be asked to hold the inquiry suggested.

MESSRS. MERRIFIELD, ZIEGLER & Co., cotton merchants, have erected a block of cotton offices close to the new Cotton Exchange, Liverpool. "Empire Buildings," as the new offices are named, occupy an area of nearly 600 square yards, with frontages to Spellow Place and Fazakerley Street. Messrs. Edmund Kirby, F.R.I.B.A., & Sons, were the architects of the building, and they have used the site to the best advantage in the erection of a block specially adapted for

"Sine Qua Non" KITCHEN RANGE.
Recent Testimonial.
Palmers Green, N.
GENTLEMEN,—My wife pronounces the "Sine Qua Non" to be the best Range she ever had. It is clean, both bakes and roasts well, and consumes little fuel.
I have had many years' experience with Ranges, this being the fourth house I have built for my own occupation.
The "Bond" Fires are also highly satisfactory.—Yours truly, (Signed) GEORGE JACKSON.

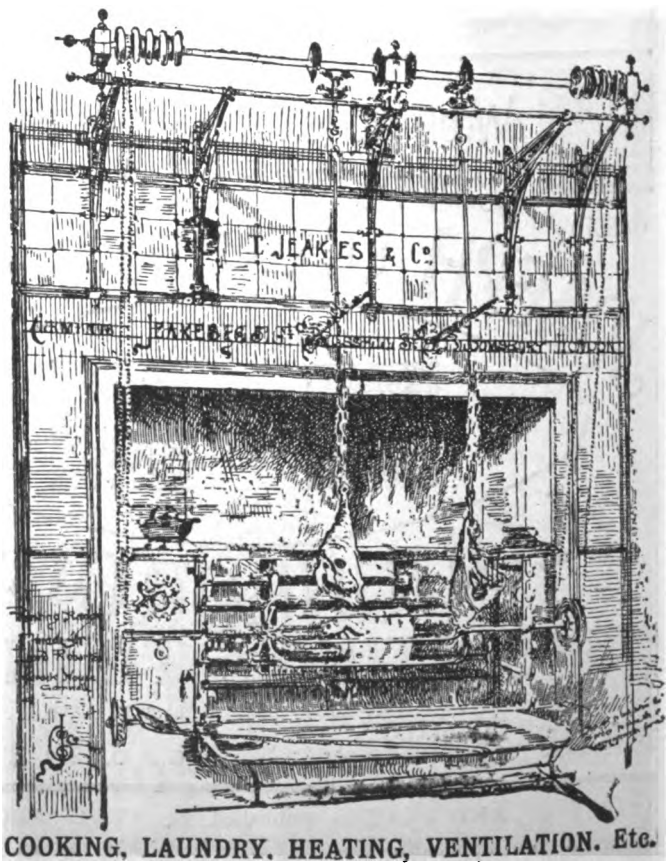
cotton offices, with the particular light in the various sale-rooms which is necessary for the sampling of cotton, and at the same time having ample office space with plenty of sunlight on all the floors. The building consists of four floors and a basement, the latter being approached by a wide flight of steps direct from the front entrance, which has been finely treated by the architects in a polished granite archway. All the cotton sale-rooms face north and north-east. There are open fireplaces for every suite of offices, no hot-water pipes being used in the building. All the lavatory accommodation has been placed at the top of the building, and a spacious lift communicates with each floor.

To those who are anticipating a restful and health-giving change from the present sphere of worry during the Easter recess, the A B C Excursion Programme just issued by the Great Central Railway Company will strongly appeal. Within its covers are conveniently tabulated a choice of resorts suitable for all tastes and requirements. The arrangements for Thursday, April 8, embrace nearly 600 seaside and inland resorts, extending through the Midland Counties, Yorkshire, Lancashire, Lincolnshire, North-East and North-West Coasts, and North of England generally. The trains are equipped with buffet cars, enabling meals to be served on board at a most reasonable tariff. The special expresses leave Marylebone at convenient times, and arrangements have been carefully made to shorten the journey of the long distance traveller by bringing his destination as near London as possible in point of time. For those who cannot leave until late on Thursday, extra fast trains are provided, departing from Marylebone at 10 p.m. and 12.30 midnight. Special trains will also be run on Good Friday, Saturday, Sunday, and Monday (Bank Holiday). Other noticeable features of the programme are the issue of Saturday to Monday week-end tickets, frequent day and half-day facilities, and cheap cycle and pedestrian tour tickets to the picturesque and historical country in Middlesex, Herts and "Beechy Bucks." Copies of this comprehensive publication may be obtained free at Marylebone Station, Company's town offices and agencies, or by post from Publicity Department, 216 Marylebone Road, N.W.



NEW CATALOGUES.

IT is almost half a century since the Maenofferen Slate Quarry Company, Ltd., were incorporated to purchase quarries in the parish of Festiniog, Merionethshire. Their underground workings have now reached a depth of 1,500 feet from the top of the inclined haulage tramway, and extend in a horizontal direction for about half a mile. It would be interesting to discover how many tons have been excavated and supplied to the trade. The total must be very high, for the slates are known on the Continent and in the British colonies. The main portions of the workings are in the "old vein" of Festiniog. The "best" Maenofferen slates are perfectly straight with a smooth surface and a uniform colour of deep blue-grey, which, owing to the absence of mineral marcasite, never becomes spotty. The remainder of the workings are in the "back vein." The standard thickness for the slates is six to the inch. Tests carried out by Mr. Bertram Blount, F.I.C., as to analysis, absorption of water, transverse breaking strain, and action of acids, are all of a very satisfactory character and well support his conclusion that "the slate is of normal composition, resists the action of acids well, and has a small absorption of water, and good transverse breaking strain." A word of commendation should be given to the excellent manner in which this booklet has been produced.

"Perpetuin" is the name of a new mineral paint free from organic substances, manufactured by the Steingewerkschaft Offenstetten A.G., Munich, and for which the sole agents in this country are Pattenhausen Bros., Ltd., 40 Great Tower Street, E.C. Its constituents are a dry powder and a petrifying liquid (a special solution of silica) called Perpetuin Fixative; the two can be easily mixed together. This liquid is a nonpoisonous colourless preparation which amalgamates chemically with the stone as well as lays on it a thin protective layer; it likewise prevents damp and mouldy walls. A preliminary undercoat of it is recommended where the surfaces are weather-worn, or when the absorbing capacity is remarkable. Plaster which is in a perfectly hard and clean condition generally needs merely an undercoat of Fixative and one coat of paint. In the case of fresh plaster or cement plaster which is only just surface dry, or for damp walls, two coats of Perpetuin paint may be applied

C. JEAKES & Co., ENGINEERS, 51, Gt. Russell St., LONDON

COOKING, LAUNDRY, HEATING, VENTILATION, Etc.

Digitized by Google

directly. This durable and washable paint is suitable for exterior and interior work on stone, brick, plaster, stucco, mortar, cement, iron, wood, &c. It is said that for ordinary plaster of average absorption one cwt. of paint (45 lb. of colour powder and 67 lb. of Fixative) will cover about 175 square yards with the two necessary coats, the second coat being much thinner than the first.

The Stamford and Casterton freestone was specified by architects five hundred years ago, as, for instance, in the King's College Chapel and Clare College, Cambridge. The open quarries owned by Mr. J. Woolston, Stamford, have recently been equipped with modern machinery, so that large supplies can be delivered at short notice. From 10 to 15,000 cube feet of weathered stone of portable sizes is always kept in stock, and in addition there is a large stock of rock-faced and chopped walling stone. Mr. John Woolston claims that while it is the easiest wrought stone in England, it at the same time hardens with exposure.

Messrs. S. W. Francis & Co., Ltd., have brought out an up-to-date illustrated catalogue and list of prices descriptive of their shutters, brass front and stall plates, &c. The reputation of the firm was established many years ago, and the completeness of their latest catalogue shows that the business is a progressive one.

Messrs. R. Waygood & Co., Ltd., have issued a revised catalogue of their hydraulic lifts and hoists—work in which the firm have specialised for nearly forty years. The new edition deals shortly with that whole branch of engineering and explains low and high pressure systems—*i.e.* where the water is taken in the one instance from the ordinary street mains at a pressure varying from 30 lb. to 80 lb. per square inch, or from a tank at the top of the building; or, in the other, where the supply is obtained by pumping water into an accumulator usually loaded to 700 lb. per square inch. It also treats of direct acting and suspended lifts. The choice mainly depends on the load to be raised, height of travel, size of cage or well-hole in which the lift is to travel, the pressure of water available. The illustrations show how widely Messrs. Waygood have been called upon to carry out their operations. They are equally ready to supply a lift for raising a soup tureen as one for lifting a railway carriage.

The Check-Fire Door Co. in their doors make great use of asbestos, the pre-eminent fire-proof mineral. Layers of this composition are inserted between a thin sheet-iron cover-plate and a perforated cover-plate (for the exterior), and the whole fixed in an angle iron frame with a cover strip and triangular plates at the corners. The perforations prevent the asbestos from becoming red-hot, and likewise prevent the plate from buckling. The thin sheet iron which sustains the direct fire contact is so arranged that the tendency to buckle is overcome likewise. The outer covers can be ornamented to any desired extent without diminishing the efficacy. The Check-fire Door, it will thus be seen, embodies many ideas which are altogether novel, although the principles on which their efficacy depend have been long established.

The alphabetical and number index alone for the latest general catalogue of Messrs. Rownson, Drew & Clydesdale, Ltd., of 225 Upper Thames Street, E.C., extends to fourteen closely printed pages; but by its means the 560 pages that follow are made easy for reference. This is no easy feat in such a large business as that of wholesale and export hardware merchants, metalworkers and ironfounders, with their several departments. The multitudinous illustrations are remarkably well reproduced and have been carefully selected so as to avoid wearisome repetition of goods that only differ minutely. The principal departments are as follows:—Ironmongery and brassfoundry; stoves, ranges, baths, &c.; castings—special, general and sanitary; tools for wood and metal working; contractors' plant, engineers' stores; bar, hoop and sheet iron and steel, constructional and general wrought-iron work. Messrs. Rownson, Drew & Clydesdale can well claim that the goods offered are thoroughly up to date in design and construction, and of such quality as will maintain the good reputation they have long held in this respect. By maintaining large stocks they are ready for prompt despatch.

An exhibition of the arts, sciences, manufactures, industries, and products of Great Britain and of Japan, on an extensive scale, will be held at Shepherd's Bush next year. The Imperial Japanese Government are supporting the scheme.

WARING'S

(WARING & GILLOW, LTD.)

Beg to intimate that they are prepared under the personal direction of Architects, to

BUILD, ALTER OR ENLARGE

Hotels, Public Buildings, & Town & Country Houses of any size.

The feature of their Constructional Work is Soundness and Stability, combined with Rapidity of Execution.

In Waring's vast New Building, recently opened, there are Departments for everything in connection with either Contract or Private Work, and Architects may be assured that their wishes will be faithfully and carefully carried out by efficient workmen under expert supervision.

Waring's manufacturing resources enable them to satisfy Architects' requirements at the lowest tender prices.

BOROUGH POLYTECHNIC INSTITUTE.

The annual exhibition of students' work was held on Saturday afternoon last at this well-known Institute in the Borough Road, and ample testimony was again afforded of the thoroughness of the instruction which is afforded in the various classes, under the superintendence of the Principal, Mr. C. T. Millis, M.I.C.E. In the art department, which is under the direction of Mr. R. B. Poynder, there was an interesting display, and it is noteworthy that the course of instruction here is arranged with a view to its application to the requirements of the building trades. The members' work, too, of the Photographic Society (Mr. A. G. Buckham, hon. secretary) reflected, generally speaking, great credit, and formed a record show. In the engineering and building trades' department ample provision is afforded for all that is requisite to afford sound instruction, and in order to accommodate the large number of students a new block of buildings was recently erected, comprising engineering laboratories, lecture theatre and drawing offices, &c., as mentioned some time ago. In the workshops open for inspection, relating to bricklayers, carpenters, plumbers, &c., there was much to be seen worthy of notice; and in the builders' drawing office the exhibition of work bearing on the various trades holds out great promise of the craftsmen of the future. Nor should mention be omitted of the practical work in the wood and metal workshops by boys of the Day Trade School, showing that students have scientific and technical instruction so as to qualify them for the various trades in order that they may become skilled and reliable workmen.

The Medico-Legal Society, at their last meeting, adopted the following resolution, which was carried on the motion of Dr. R. J. Collie:—"That the Council be asked to appoint a committee to consider and report as to what action (if any) by the society is desirable in the matter of the alleged unsatisfactory working of the Workmen's Compensation Acts." The discussion arose out of papers read by Mr. A. S. Morley and Dr. Collie, in the course of which the evils of malingering were alluded to and the tactics of speculative solicitors and unscrupulous doctors denounced.

AUSTRALIA'S GIGANTIC DAM.

By John Plummer, of Sydney.

The New South Wales Government has undertaken the construction of an immense engineering work in the shape of a reservoir, the storage capacity of which will be somewhat in excess of that of the Aswan dam in Egypt, and having a head of water fully 200 feet in height, against 90 feet at Assouan, the greatest head of the Aswan dam The undertaking is being achieved by throwing a colossal dam across the river Murrumbidgee, a magnificent stream in the southern portion of the State and which runs from east to west a distance of about 1,350 miles, of which 500 miles are navigable. The area of the basin drained by the river is estimated at 25,725 square miles, or, with its affluents, 57,000 square miles. It flows into the Murray, the Australian Nile, and thence to the sea, only a comparatively insignificant portion of its waters being used for irrigation purposes. The banks on the upper portion of the river are extremely high and even precipitous, the mountainous country through which it flows being intersected by numerous cliffs and yawning chasms of immense depth. Advantage has been taken of a portion of the lofty walls of rock formed by mountains rising in successive elevations during a part of the river's course to a height of 2,000 feet, to construct a dam 200 feet in height, thus throwing the river back a distance of forty miles and forming a vast lake, which will be fed also by the waters of two large tributary streams, the Goodradighee and the Yass, the whole constituting a body of water half as large again as that contained in Sydney Harbour, the quantity being estimated at 206,000,000,000 gallons.

The site of the dam is the narrowest part of an immense gorge, the structure itself being composed of cyclopean rubble in the form of blocks of red granite weighing from 10 to 15 tons each, bedded in concrete. The total height from foundation to crest will be about 240 feet, equal to the highest structure of its kind in the world. At the top it will span the gorge for a distance of between 800 and 900 feet, and at the bottom for about 150 feet, with a thickness of fully 200 feet, gradually diminishing to 20 feet at the top. When finished the dam will hold up 215 feet of

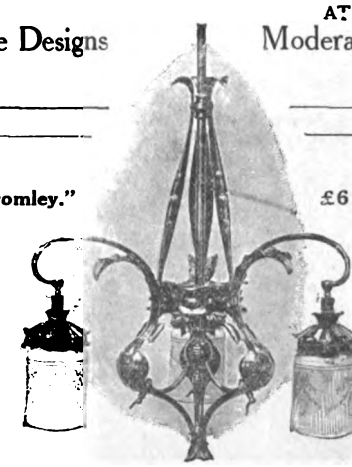
water, and be furnished with a by-wash on either side for the passage of flood waters, discharging them into a gully of solid rock below the dam. The rocks on either side of the dam are of solid granite, and the work of construction has been likened to thrusting a cork into the mouth of a bottle to prevent the contents from escaping. In connection with the dam there will be a system of canals on either side, that on the north, which will be proceeded with first, embracing an area of about eighty square miles, affecting over one and a half million acres, of which 370,000 acres will be suitable for fruit-growing and intense culture generally, 260,000 acres for mixed farming, and 870,000 acres for pastoral purposes. There will also be a series of main and subsidiary distributing channels, taking off water at intervals from the main and branch canals to distribute it to the various small holdings.

An extensive area of the river flats and other low-lying country, of a rich character, will become permanently submerged, many hills transformed into small islands and a picturesque shore-line created, the surrounding scenery being of the grandest description. The quantity of high-class irrigable land commanded by the main canal is estimated at 357,000 acres, nearly half of which is freehold held in big estates, on which it is proposed to impose an irrigation rate, leaving the sub-division in the hands of the present owners if they should so desire. The balance, consisting of Crown, conditionally purchased and conditionally leased lands, the State Government proposes to acquire and sub-divide into small irrigation holdings of 100 acres each, and to dispose of the same to settlers on easy terms. These holdings will be liable to an irrigation rate of 5*s*. per acre foot, or an annual charge of from 10*s*. to 12*s*. 6*d*. per acre for a full supply of 24 to 30 acre inches. The soil in the locality, especially near the hills, is admirably adapted for irrigation culture, capable of growing to perfection all fruits suitable to the climate, also lucerne and fodder crops of every kind.



The work of construction was commenced in 1908, but already there is a large population of 600 or more workers and their families, with all the characteristics of a busy thriving township. No drinking-shops are allowed and sly grog-selling is vigorously repressed. A considerable portion of the machinery required is being obtained from America and England, the cost being unexpectedly increased to a considerable extent by the new Federal tariff. The machinery will be electrically driven from a central station, and will enable much of the construction work to be more easily effected. At present the main difficulty is to get the large quantities of cement required down the precipitous sides of the gorge. It is slid down part of the way by means of wire ropes, then carried in bags on poles, and finally in bags on the shoulder. The new arrangement will consist of a couple of immense Ledgerwood cableways of 1,200 feet span, capable of handling loads of 15 tons. Anchored on great travelling towers on each side of the gorge they will command the dam, and in addition there will be two other cables to handle the material from the by-washes. During the work of construction, which is being rapidly pushed on during the summer months, when the rainfall is lightest, the river will be partially diverted from its course.

The Egyptian Public Works Department invites tenders for the construction of sewage purification works for Cairo, for a main collector, for the surface water drainage of Cairo, and for the sewerage of Zeitoun and adjacent suburbs. Tenders are restricted to firms who, either themselves or their predecessors in business, during the last ten years, have carried out works in connection with sewage disposal of an aggregate value of E300,000*l*. A separate contract will be let for the rising main. Conditions of tender may be obtained in this country from the Commercial Intelligence Branch of the Board of Trade, London; Sir Douglas Fox & Partners, London; or Lieut.-Colonel Western, Westminster.

The Marylebone Borough Council propose to appeal to the Local Government Board against the refusal of the London County Council to sanction a loan of 8,000*l*. for the purpose of substituting electric for gas lighting in the principal streets of the borough where the distributing mains of the council's electricity undertaking are already laid. Meanwhile the electric supply committee of the borough council have decided to carry out the work. The town clerk states that the saving to the general rate account by the substitution of electric for gas lighting in the case of 1,964 lamps would be 951*l*. per annum.

GLASGOW STREET PAVING.

The minutes of the Glasgow statute labour committee, submitted at the meeting of the Town Council last week, contain the report by the representatives of the Corporation of the First International Roads Congress, held in Paris last October. As a result of the Congress the representatives submitted a series of recommendations as to future paving in the city. The subscribers agreed that wood paving is not satisfactory. It is the most expensive kind of paving. It is very short-lived; it very soon becomes uneven and irregular, and therefore to some extent noisy, and climatic conditions are altogether detrimental to it. Accordingly the subscribers were not prepared to recommend any renewal or extension of this class of paving. In streets without tramways, in and near to the business parts of the city, and in main thoroughfares through the suburbs, in which streets and thoroughfares there is more or less continuous traffic, and where the gradient is not steeper than, say, 1 in 55, the paving thereof should be of compressed rock asphalte. There should be throughout the city a considerable extension of such paving. Where, in the same class of streets, the gradient is, however, steeper than 1 in 55 the paving should, according to circumstances, be square-dressed setts, either of granite or of whin; where of granite the setts should be nidged in the more important streets in the central districts of the city. Where, in such streets as have been described, there are tramways the paving to be used should be of square-dressed granite setts. Such setts should in the more important streets be nidged. If in any case the Corporation should determine to pave such streets with compressed rock asphalte, there should be a course of wheelers alongside the rails. In the case of those streets in the central and other districts of the city where there are no tramways, and where the traffic is not likely to be great, and which are more or less of a residential character, the paving should be of asphalte or tar macadam, according to the importance and gradient of the street, unless that gradient is so steep as to render the adoption of smooth paving inadvisable. In suburban streets where there are no tramways, and if of a main or important character, the paving should also be of compressed rock asphalte. In the less important of those streets the paving should be of tar macadam, and in the remaining streets having little or no vehicular traffic the paving should be that of ordinary macadam, the gradient being, of course, considered in each case. In such streets, if there are tramways, the paving should be of square-dressed granite setts, and the street should be paved over its full width. As regards private streets, courts and lanes, the paving should be as far as possible that recommended in the case of central and district and suburban streets, but each such street must be determined by its special and particular requirements, its situation, and its gradient. Rubble causeway being so insanitary and otherwise very objectionable should as far as possible, both in public and private streets, be superseded whenever opportunity arises. Where smooth paving is adopted, all gullies and manholes should be so constructed as to prevent detritus being carried into the sewers. If the Corporation should adopt the recommendations as to the smooth paving of streets it would be expedient that there should be in certain of such streets extensive and frequent sanding, and accommodation should be provided at junctions of streets or other suitable places for storing the sand or gravel to be used. They also call attention to the necessity of keeping absolutely clean streets paved with compressed rock asphalte, and suggest that the cleansing committee consider as to obtaining one or more watering machines, with squeegee attached, so as to remove all refuse and water immediately after the street had been watered or washed. The asphalte, if treated in this way, would dry very quickly, and would not be slippery. Private streets should not be taken over as public streets unless they are put into a condition in conformity with these recommendations. In new streets the various departments, as also the Post Office, should be taken bound as far as possible to lay their pipes and cables in the footpaths. If such pipes and cables are to be laid in the carriageway they should be laid before the street is completed, even if it means an extra capital expenditure, as it is impossible to restore a street satisfactorily after it has been opened, unless the street is to be re-paved over its full width. In any street where pipes or cables are laid by any department or by the Post Office, such department or the Post Office should be obliged to make reasonable provision for the future requirements of their respective undertakings. The report has been submitted to the sub-committee on streets repair.

Art Plates from "The Architect."

AWARDED GOLD MEDALS, INTERNATIONAL HEALTH EXHIBITION AND ARCHITECTURAL AND BUILDING TRADES EXHIBITION (1889).

PROOFS on PLATE PAPER of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form on proof paper suitable for framing.

***The Corn Field.*—(1) Ploughing; (2) Harrowing; (3) Mowing; (4) Carting; (5) The Products of the Corn Field.**

In Five Separate Plates. Total Length, 14 ft. 7 in. by 15 in. deep. A splendid example of Colour Work in Permanent Ink Photo. By M. PAUL ALBERT BAUDOIN. This magnificent Illustration was presented to the Subscribers to "THE ARCHITECT," in 1886. A few proofs were taken which immediately became out of print.

OPINIONS OF THE PRESS.—"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition has been issued."—*The Lady's Pictorial.* "They are beautifully done in colours by the permanent ink-photo process and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—*The Stage.* "The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour work in permanent ink photo by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic and would grace the walls of any house."—*The Gentlewoman.* AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates they have been reproduced by Subscription at Half a Guinea the Set, free by post, carefully packed inside patent roller, and are now ready for issuing. Immediate application is requested. May be had framed in Black Reeded Frame with Gold Mounts, price Three Guineas the Set of Five Pieces.

Galatea.

From the Painting by RAPHAEL in the Villa Farnesina, Rome. Size 30 in. by 22 in. Price Two Shillings. Free by post, carefully packed inside patent roller.

St. George.

From the Painting by RAPHAEL, in the Louvre. Size 15 in. by 20 in. Price One Shilling and Sixpence. Free by post, carefully packed inside patent roller.

May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON's Bookstalls, or from the

Publisher, P. A. GILBERT WOOD, Imperial Buildings, Ludgate Circus, London, E.C. (*FULL LISTS ON APPLICATION.*)

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

SAVE 50%
OF YOUR
COAL BILL
BY USING THE PATENT
"Bond" Stove
Recent Testimonial.
Chelmsford, 12th January, 1909.
DEAR SIRS,—I have very great pleasure in stating the "Bond" Stoves have given me entire satisfaction, and I have no hesitation in saying, that if I were purchasing stoves for a new house I should, with my present experience, have all the fireplaces fitted with them. Apart from the great heat generated, and thoroughly distributed about the room, they are most economical in coal consumption.—Yours very truly,
(Signed) WILLIAM F. GEPP.

Scagliola Marble

An old Italian process, revived in the early part of the Sixteenth Century by Guido Sassi; is not a surface decoration, but a thoroughly artistic material. It was largely used by the Florentines in some of their most elaborate works, and was introduced into this country by Mr. J. Wyatt about 1750. It has been manufactured by this firm for the last 85 years, and fixed in many of the most important buildings in the Kingdom.

By Special Appointment

To His Majesty.

SPÉCIALITÉ for surrounding Iron or Brick Cores.

These being fixed in the ordinary course of construction the Scagliola can afterwards be fixed round **WITHOUT SHOWING JOINT.**

TRADE NOTES.

THE new post office, Spalding, is being ventilated by means of Shorland's patent exhaust roof and special inlet ventilators, the same being supplied by Messrs. E. H. Shorland & Bro., of Manchester.

THE Capital and Counties Bank have acquired the premises at 35 Queen Victoria Street, so long occupied as showrooms by Messrs. Tangyes, Ltd., and the necessary reconstruction is now taking place. The Portland stone columns on the frontage have all been cleaned by the Farnham patent sand-blast process, which has given them the appearance of absolutely new stonework.

RICHARD MORELAND & SON, LTD., give notice that they have removed their engineering works from Old Street to Silvertown. Their general offices will still remain at 80 Goswell Road, London, E.C.

THE London Fire Brigade's equipment was last week augmented by two more motor appliances each comprising a petrol motor escape van and combined "first aid" fire engine, thus completing orders for three such vehicles carried out by Messrs. Merryweather & Sons. These latest machines are driven by a 55 h.p. four-cylinder motor, and can travel at twenty-five miles an hour on the level with a full load and negotiate any hill in the London district. They were officially tested during the severe snowy weather at the beginning of March. The roads, covered inches deep in snow, presented no difficulties to the rubber-tyred motors. The tests were in every way satisfactory, being well maintained in spite of the adverse conditions.

VARIETIES.

THE baths to be provided in Accrington are part of a larger scheme, funds not being available at present for the whole project. The present outlay will be 10,500*l.* upon a swimming bath (75 feet long by 30 feet wide), and sixteen private baths. The full project when carried out will more than double this accommodation.

THE Dumfries Town Council last week discussed the question of restoring the town hall, which was burned some time ago, or providing a new town hall with municipal buildings. It was agreed in the meantime to adopt the restoration scheme, which can be carried out with 1,200*l.*, which was got from the insurance companies.

SURVEYING operations were begun last week in connection with the construction of oil tanks, which form part of the permanent works at the naval base at Rosyth. The site selected for the tanks is to the west of Rosyth Farm. Arrangements are being made for the forwarding of a number of Lubecker excavating machines, which are of German construction, and are said to be much more powerful than the ordinary type of steam navvy.

MODERN NAPLES.

AN interesting consular report has been sent by the British Consul-General at Naples on the trade of Southern Italy for the year 1908. Particular reference is made to the various engineering enterprises.

Iron and steel.—The work on the new smelting works at Bagnoli belonging to the Ilva Company is progressing rapidly, and it is hoped to commence working about the end of 1909, giving employment to 2,000 workmen. Large works are being carried out to collect the water from the surrounding hills, and it is hoped to obtain the 12,000 cubic metres (2,461,242 gallons) per day which are required. A large fresh water reservoir is being built. For ordinary use there is the Serino water, from the same source that supplies Naples. Powerful electric pumps are being constructed for the supply of sea water. The Ilva company has a capital of 20,000,000 lire (800,000*l.*).

Public works. Lake Avernus.—This classical lake, situated between Baia and Pozzuoli, and having a small outlet some three-quarters of a mile in length into the excellent anchorage of the bay of Baia, has long tempted engineers as a suitable place for constructing docks and shipbuilding yards. The lake is extremely deep, being in fact an ancient crater.

About sixty years ago the last of the Bourbon kings caused a quay to be built round it, constructing at the same time a small canal to the sea. The project was then abandoned, partly on account of its enormous cost and partly because the malaria from the neighbouring lakes of Patria

and Licola rendered it unlikely that the enterprise would ultimately prove successful. In the present day so much has been done to conquer malaria that speculators are encouraged to hope that by carrying out works which would make a navigable canal from the sea to the lake, the splendid basin might be utilised by ships of the largest size, and that the admixture of a considerable supply of sea water might reduce the malarious character of the stagnant waters of the lake as now existing. Fever, which it was anticipated would cause great trouble at the Armstrong Pozzuoli works, which are only about two miles off across the bay, has never appeared there to any serious extent, and this is looked upon as encouraging to the new enterprise. The capital required, which will certainly be a large sum, is said to be forthcoming from Belgium, the project being that of an Italian civil engineer, and the representative of the company in Italy, an Italian naval officer of very wide experience in the construction of docks and harbours.

New railway station.—The direct railway from Rome to Naples is making good progress, and it has been decided to place the station of it at Toretta ; it will, however, be connected with the present railway station by a line which will run through the town. The new station is to cost 360,000*l.*

New supplementary aqueduct.—For some years a plan has been on foot to construct a new subsidiary aqueduct, but the expense was estimated at 10,000,000 lire (400,000*l.*) and the treasury was empty. On the other hand a serious danger threatened Naples that in the summer it would be without water, as the Serino water in the city reservoirs becomes very low.

The municipality attributed the fact to the waste by private people, and used sometimes to shut off the water at night and forego the watering of the streets. But these actions did not stay the diminution of the water in the reservoirs. The municipality did not realise the real cause, which is that the same amount of water comes into the city as in 1888, that the city has grown since then, that the Vesuvian communes have also received Serino water from the Naples supply, and that more water is used for the streets and for flushing the sewers.

Now at last the technical committee of the municipality have approved the construction of a new supplementary aqueduct, a modification of the plan of 1903 and at a cost of 200,000*l.*, for the following purposes:—

1. So that the city should not be deprived of water if the present aqueduct should be damaged.
2. To supplement the summer deficiency.
3. To furnish new industries with the necessary water.

Sewers.—A very important addition is to be made to the Naples sewerage system by the addition of a main drain, which will carry all the house drainage of the growing suburb of Posillipo into the Naples system, which has its outflow at Cuma. The sewer will run under the main road and will, besides taking all the drainage of about a mile of houses, have a connection with the new system, which will drain the village at the top of the hill. The houses between the road and the sea will not be affected by the new scheme, but a great benefit will be conferred on the most important residential suburb of the city of Naples.

AT the London Police Summons Court last week, before Alderman Sir Vezey Strong, William Musgrove, in the employ of Messrs. Charles Gude, builders' contractors, 177 Dalston Lane, appeared in answer to a summons for causing debris arising from the demolition of a building to be removed during prohibited hours. Constable Garrett deposed that when spoken to the defendant said that the stuff was from excavating, and not demolition. Defendant stated that the constable had made a mistake. The stuff being removed was taken from 17 feet below the pavement. As a matter of fact, no pulling down had been done there for some days. Sir Vezey: Surely excavating is, in a sense, part of the work of demolition. Defendant stated that his firm had been in a good many "big City pulling-down jobs," and there had never been any complaints before. Mr. Thomas Edwin Hutchinson, a builders' foreman, gave evidence to the effect that it was an essential point to the building trades of London. Sir Vezey said he could not see that it mattered whether the material arose from the demolition of the building above or at the foundation. The effect was the same. Believing, however, that the defendant had acted under a misapprehension, he should only impose a fine of 2*s.* 6*d.* and costs.

THE O.S. WIRING SYSTEM.

It is evident that the proposal to enable consumers of gas and electricity to economise on their quarterly bills by a general manipulation of the hands of the clock at certain seasons of the year has had no effect upon the keenness of the competition between those responsible for the supply of these illuminants and their appurtenances, as the invention of this extremely neat system of Messrs. Siemens Bros. shows.

The incandescent mantle of the gas engineer was responded to—somewhat tardily, perhaps—by the metallic filament lamp, which brought the cost of electric lighting within the reach of all, yet many, especially small consumers, have been unable to avail themselves of its advantages owing to the high cost of a reliable system of wiring. This want is about to be supplied by the introduction of the so-called O.S. system, for which the following advantages are claimed:—Inexpensive in material and labour; neat in appearance; no boxes, bends or elbows necessary; can be used with standard accessories; absolute electrical continuity; mechanically strong; screwing and other special tools un-

necessary; and, for the better kind of wire, watertight. It is very easily fitted, even by workmen inexperienced in electrical matters; in fact, in this respect the patentees might almost have entitled their explanatory pamphlet "Every man his own wireman." The conductor itself is metal-cased, there being two qualities of the wire; the cheaper, called "Kuhlos," is a single or stranded conductor of copper carefully insulated and surrounded by a closely compressed sheet of brass. The patentees do not claim for this kind that it is watertight, so that it would be used for surface wiring only in dry interiors. The better quality, called "Stannos," differs from the other in that its metal case is of tinned copper, rendered homogeneous by a special process, and is

intended for use in any situation for surface or concealed wiring. Both kinds of wire are easily bent by means of an inexpensive tool for the purpose, but in this respect the "Stannos" is decidedly preferable.

The wire is supplied in lengths of 55 yards. It is unnecessary to use wood casing or iron (or steel) conduit, the

wire being fixed as unwound from the coils by means of saddles or buckle clips. The consequent neatness of appearance is a potent recommendation. For concealed work the wire has the great advantage of being of such small diameter as to fit into a narrow groove, which is easily filled up and made invisible.

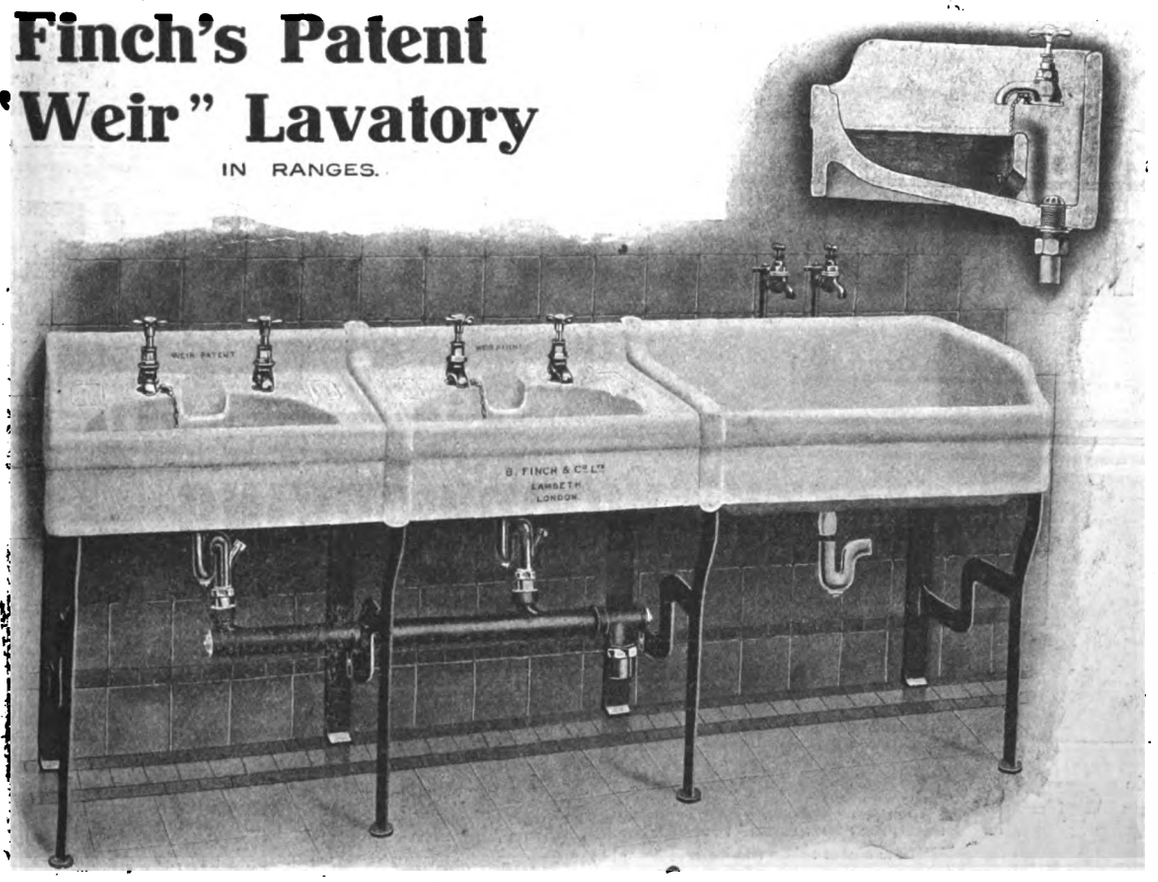
The illustrations include two continuity fixtures, "Back entry" and "Side entry," for use with the "Kuhlos" and "Stannos" wires. They are made of iron, and are used at light and switch points or for junctions, and ensure perfect electrical continuity for the copper casing. The "Back entry" fixture would be used for concealed "Stannos" wiring, and the "Side entry" for "Stannos" or "Kuhlos" surface wiring.

The wire may be fitted up as a concentric return circuit. This, in fact, is by far the most economical use to which the wire may be put, but the regulations of the Board of Trade prohibit such an arrangement if to be connected direct to the general supply mains or to an auto transformer, but with a double-wound transformer the concentric return circuit would be permitted, and such an installation would be admirable from every standpoint.

The insulation of the wires is very satisfactory and should be enduring, especially in the case of the "Stannos," on account of its being watertight. The wires are tested at a pressure of 1,000 volts. For shipboard installations special watertight fittings are supplied.

BUILDING TRADES EXHIBITION.

ARRANGEMENTS are now definitely completed for the opening of the forthcoming Building Trades Exhibition on April 17, at twelve o'clock noon.



This office will be undertaken by Mr. Ernest George (president of the Royal Society of British Architects), who will be supported, amongst others, by Sir Aston Webb, R.A., Sir George Richmond, R.A., Sir George Frampton, R.A., Sir Brumwell Thomas, Mr. Walter Cave (president of the Architectural Association), Mr. W. E. Riley, Mr. T. W. Cutler, Mr. T. W. Aldwinckle, Mr. C. Harrison Townsend, Mr. Sidney Perks, Mr. G. H. Fellowes Prynne, Mr. W. H. Seth-Smith, Mr. R. Frank Atkinson, Mr. Arnold Mitchell, Mr. Arthur Keen, Mr. George Yeates, Mr. Allan George, Professor F. M. Simpson, Mr. Ernest Newton, Mr. John Slater, Mr. Arthur Bolton, Mr. H. P. Burke Downing, Mr. Matthew Garbutt, Mr. Wm. Grellier, Mr. F. R. Farrow, Mr. Banister Fletcher, Mr. A. H. Ryan-Tenison, Mr. Theodore Fyfe, Mr. F. Dare Clapham, Mr. Louis Ambler, Mr. Charles FitzRoy Doll, Mr. A. Needham Wilson, Professor Henry Adams, Mr. John W. Simpson.

The exhibition will remain open until Saturday, May 1. This year's event will eclipse all previous records, both in regard to number of exhibitors and the thoroughly representative character of the exhibits generally.

The following special visits have been arranged:—Saturday, April 17, Architectural Association, at three o'clock; Tuesday, April 20, National Federation of Building Trades Employers, at 5.30; Wednesday, April 21, Royal Sanitary Institute; Friday, April 23, Society of Architects; Saturday, April 24, Institution of Municipal Engineers, 10.30 A.M., and Royal Sanitary Institute; Monday, April 26, Surveyors' Institution, 2.30; Wednesday, April 28, Institute of Sanitary Engineers.

THE Norwich city engineer (Mr. A. E. Collins), in the course of his synopsis of the principal work done by his department last year, mentions that contract drawings, full size details, &c., have been prepared and contract let for new twelve-bed isolation pavilion at the Isolation Hospital, at a cost of 2,797*l*., and the work is making rapid progress. Numerous details have been made for various works in connection with Guildhall restoration, and several photographs have been taken from time to time, showing objects of interest. The necessary details for new oak roof over magistrates' court and new committee room are receiving attention. Necessary plans, sections, &c., have been prepared of guildhall and municipal offices in connection with proposed heating scheme. A scheme has been prepared for the provision of a lecture hall to seat 560 persons at the Castle Museum. Plans and estimates for proposed playground and gymnasium at Priory Yard have been made for submission to the Local Government Board. Also large scale drawings and estimate for proposed public convenience in the market, at the rear of the Wellington statue. Various sketches and photographs of the old city wall, recently exposed in Coburg Street, have been made and will be kept as records.

THE CONCRETE INSTITUTE.

THE Concrete Institute, which was founded last year, has now attained a membership exceeding 600, of whom the larger number are members of the Institution of Civil Engineers, Royal Engineer officers, architects and surveyors holding public appointments or practising in their private capacity. The Institute has already been incorporated, the incorporation having recently been granted by the authorities concerned. The governing body is a Council of twenty-eight members, among whom are the Earl of Plymouth, C.B., president; Sir Douglas Fox, J.P., Sir Wm. Mather, LL.D., Sir Wm. Preece, K.C.B., Sir Henry Tanner, I.S.O., vice-presidents; Mr. Edwin O. Sachs, F.R.S.Ed., chairman; Mr. E. P. Wells, J.P., hon. treasurer; and Mr. A. E. Collins, M.Inst.C.E., hon. secretary. Standing committees have been elected to deal with various technical matters, and sub-committees of the standing committees have already been appointed to deal with matters of detail. It may be of interest to note the list of standing committees, with the names of their chairmen and hon. secretaries. They comprise the following:—

Science Standing Committee.—Mr. William Dunn, F.R.I.B.A., chairman; Mr. F. E. Wentworth-Sheilds, M.Inst.C.E., hon. secretary.

Parliamentary Standing Committee.—Mr. A. Ross, M.Inst.C.E., chairman; Mr. J. Ernest Franck, A.R.I.B.A., hon. secretary.

Reinforced Concrete Practice Standing Committee.—The Chairman of the Executive, chairman pro tem.; Mr. R. W. Vawdrey, B.A., Assoc.M.Inst.C.E., hon. secretary.

Tests Standing Committee.—Mr. W. T. Hatch, M.Inst.C.E., chairman; Mr. W. G. Kirkaldy, Assoc. M.Inst.C.E., hon. secretary.

Mass Concrete Standing Committee.—Mr. C. H. Colson, M.Inst.C.E., chairman.

The number of general meetings already held is four, and the next meeting will take place at the Royal United Service Institution on May 27. The Council and committee meetings take place at the offices of the Institute, No. 1 Waterloo Place, Pall Mall, S.W., to which address applications as to particulars should be made. The Institute is taking up a strong position in the matter of the proposed amendments to the London Building Acts, and has petitioned Parliament on the subject. The first volume of Transactions has already been issued, and the second volume will be issued this month. Circular letters with a view to collating information are being prepared on matters affecting the rusting of steel, expansion and contraction, algebraical notation, the specification of dampness in concrete mixtures, &c. It was originally intended to raise the annual subscription to two guineas per annum for new members at an early stage, but it has now been decided that the annual subscription of one guinea shall stand for new members who join the Institute before October next.

NOTTINGHAM STATION.

NOTTINGHAM, one of the principal railway centres in the United Kingdom, is admirably served in respect to railway facilities.

New Midland Station.—In point of accommodation the Midland Company's equipment in Nottingham is second to none of that of any provincial city. New commodious passenger and goods stations have been provided in convenient localities. The buildings which form the high-level portion of the former are conspicuous by the spaciousness of the scale upon which they have been planned and the handsomeness of the internal appointments. The frontage to Carrington Street is 320 feet and the block from front to rear 135 feet, whilst the general height of the building is 40 feet, the central clock tower rising to 72 feet. The entrances to the carriage annexe—320 feet by 56½ feet—have high elliptical arches, with Ionic columns and massive double gates of iron-bronze openwork. The booking hall, 104½ feet by 42 feet, has dark green glazed blocks and buff terra-cotta for the embellishment of the walls. The front of the booking office is treated in the same colours, and the roof of the hall is half-timbered. Of the eight ticket-windows seven are for third-class passengers, and they are classified into districts in the usual way. The cloak-room is spacious, and in addition to the customary partitions for luggage and parcels, a number of patent racks for bicycles are provided.

Platforms.—From each end of the booking hall wide passages lead to the main corridor, off which three broad stairways and two luggage lifts communicate with the five platforms. The latter are each a quarter of a mile in length, and contain waiting-rooms, refreshment and dining rooms, and lavatories and hairdressing rooms. Adjoining the station street entrance are parcels offices. A fish-stage and dock for horse, carriage and motor traffic is connected with this side of the station. The entire premises are lighted by electricity, and hydraulic lifts convey passengers' luggage from the main entrance in Carrington Street to the platforms.

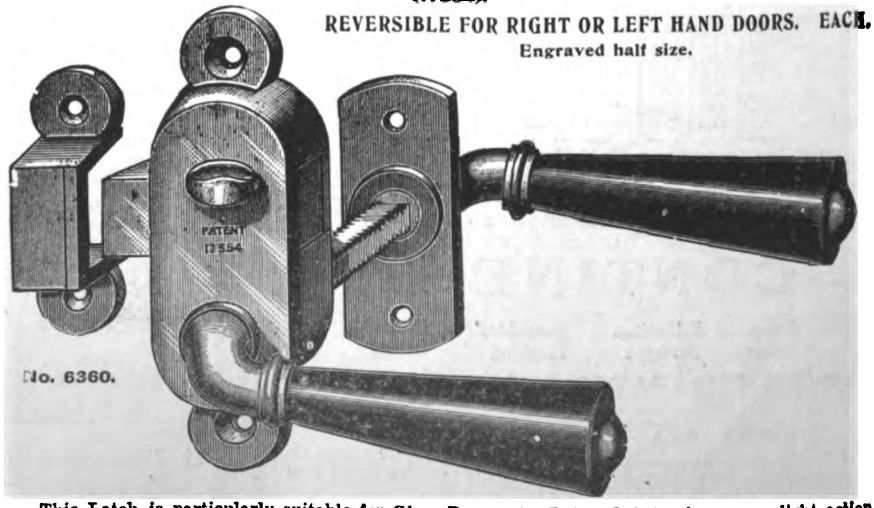
MANUFACTURER OF

Best Cast Brassfoundry, Ball, Roller-bearing and other Axle Pulleys, Enamelled Iron Work, French Window Bolts; Patentee and Original Maker of the Solid Machine-made Brass Butt Hinge universally known as the "ARROW" Brand.

THE "ARROW" HINGE.

Narrow Suite, 1, 1¼, 1½ ins.
Broad Suite, 1½, 1¾, 2, 2¼, 2½, 2¾, 3, 3½, 4 ins.
Strong Suite, 2½, 3, 3½, 4 ins.



Advantages.—Squareness of edge, uniformity of thickness, good finish and smoothness of action. Each Hinge bears my Trade Mark back and front.

PATENT REVERSIBLE SHOP DOOR LATCH.

(17354).

REVERSIBLE FOR RIGHT OR LEFT HAND DOORS. EACH.

Engraved half size.

This Latch is particularly suitable for Glass Doors, the Latch Bolt having a very light action independent of the handles. The Bolt can be fastened, either in or out, by pulling the thumb-bit, seen above the word "Patent," and turning it at right angles. The Bolt can be reversed by simply taking off the back plate and reversing the spring lever and bolt.

PATTERN BOOK WILL BE SENT ON APPLICATION. ***INDENTS THROUGH BRITISH MERCHANTS.***

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tender, and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

SCHEDULE C.

Metals and Manufactures of.

Beams, girders, joists, angles, channels, car-truck channels, T T columns and posts or parts or sections of columns and posts, deck and bulb beams and building forms, together with all other structural shapes of iron or steel, whether plain or punched or fitted for use, three-tenths of 1 cent per lb.

The following articles may, under certain conditions, be imported free:—

Professional books, implements, instruments and tools of trade, occupation or employment in the actual possession at the time of arrival of persons emigrating to the United States; but this exception shall not be construed to include machinery or other articles imported for use in any manufacturing establishment, or for any other person or persons, or for sale.

Regalia and gems, statuary and casts of sculpture, for use as models or for art educational purposes only, where specially imported in good faith for the use and by order of any society incorporated or established solely for religious, philosophical, educational, scientific or literary purposes, or for the encouragement of the fine arts, or for the use and by order of any college, academy, school, seminary of learning, orphan asylum or public hospital in the United States, or any State or public library, and not for sale, subject to such regulations as the Secretary of the Treasury shall prescribe; but the term "regalia" as herein used shall be held to embrace only such insignia of rank or office or emblems as may be worn upon the person or borne in the hand during public exercises of the society or institution, and shall not include articles of furniture or fixtures, or of regular wearing apparel, nor personal property of individuals.

Works of art, drawings, engravings, photographic pictures and philosophical and scientific apparatus brought by professional artists, lecturers or scientists arriving from abroad for use by them temporarily for exhibition and in illustration, promotion and encouragement of art, science or industry in the United States, and not for sale, shall be admitted free of duty, under such regulations as the Secretary of the Treasury shall prescribe; but bonds shall be given for the payment to the United States of such duties as may be imposed by law upon any and all such articles as shall not be exported within six months after such importation: Provided that the Secretary of the Treasury may, in his discretion, extend such period for a further term of six months in cases where applications therefor shall be made.

Works of art, collections in illustration of the progress of the arts, sciences or manufactures, photographs, works in terra-cotta, parian, pottery or porcelain, antiquities and artistic copies thereof in metal or other material, imported in good faith for exhibition at a fixed place by any State or by any society or institution established for the encouragement of the arts, science or education, or for a municipal corporation, and all like articles imported in good faith by any society or association, or for a municipal corporation for the purpose of erecting a public monument, and not intended for sale nor for any other purpose than herein expressed; but bonds shall be given under such rules and regulations as the Secretary of the Treasury may prescribe for the payment of lawful duties which may accrue should any of the articles aforesaid be sold, transferred, or used contrary to this provision, and such articles shall be subject at any time to examination and inspection by the proper officers of the Customs: Provided that the privileges of this and the preceding section shall not be allowed to associations or corporations engaged in or connected with business of a private or commercial character.

Works of art, the production of American artists residing temporarily abroad, or other works of art, including pictorial paintings on glass, imported expressly for presentation to a national institution or to any State or municipal corporation, or incorporated religious society, college or other public institution, except stained or painted window glass or stained or painted glass windows; but such exemption shall be subject to such regulations as the Secretary of the Treasury may prescribe.

DETAILS of the new water scheme prepared by Messrs. Hodson & Son, Loughborough, were considered by Wirksworth Council. The Wigwell watershed is recommended for the new source, this yielding, it is estimated, 700,000 gallons a day. The cost of the scheme, the engineers said, would be about 7,000*l*.

Modern Homes.

By C. RAFFLES DAVISON,

Editor of "THE BRITISH ARCHITECT."

With over 300 Illustrations from Photographs and Pen Drawings by the Author.

"A book on Modern Homes by Mr. Raffles Davison must surely prove attractive to all who care for the present-day progress of domestic architecture, as well as to those who care for the truthful and dainty representation of it. . . . Here we have selected, by one who knows, some of the best and most representative modern homes. Views of their exteriors and interiors, staircases, chimney corners, halls and furniture, often accompanied by plans just sufficient to place them in their surroundings, with very often a sketch or two in the garden, and sometimes a photograph. The drawings are accompanied by just enough letterpress to draw attention to the strong points of each design."—From Sir ASTON WEBB'S Foreword.

THE

GREAT CENTRAL RAILWAY

IS

"THE COMFORTABLE LINE."

☞ **THE LONDON EXPRESS TRAINS CENTRE ON SHEFFIELD**

BRANCHING THEREFROM

WESTWARD to Manchester, Oldham, Stalybridge, Stockport, Warrington and Liverpool;
NORTHWARD to Huddersfield, Halifax, Bradford, Leeds and York;
EASTWARD to Doncaster, Grimsby, Hull and North Lincolnshire.

☞ **CROSS COUNTRY EXPRESSES & THROUGH ARRANGEMENTS WITH OTHER COMPANIES are a distinct feature of the Great Central Services.**

NEWCASTLE, SUNDERLAND, DURHAM, YORK, MANCHESTER, BRADFORD, HUDDERSFIELD, ROTHERHAM and SHEFFIELD are provided with through trains via Nottingham, Leicester, Banbury and Oxford, to and from Southampton, Bournemouth, and the South Western line.

BATH, BRISTOL, WESTON-SUPER-MARE, EXETER, TORQUAY, KINGSWEAR, PLYMOUTH, and the CORNISH RIVIERA are reached by Express Trains from Leeds, Wakefield, Halifax, Huddersfield, Sheffield, Nottingham and Leicester.

THE SERVICES BETWEEN THE GREAT WESTERN AND GREAT CENTRAL SYSTEMS CENTRE UPON OXFORD FOR SOUTH AND WEST, AND BANBURY FOR CHELTENHAM, GLOUCESTER, NEWPORT, CARDIFF AND SOUTH WALES.

Via MARYLEBONE is LONDON'S POPULAR ROUTE for STRATFORD-ON-AVON.

All Express Trains include Buffet, Breakfast, Luncheon or Dining Cars

TICKETS are issued in advance at all offices, or by Messrs. Dean & Dawson, the Company's Agents, who also book to the Continent by any Channel Service in connection with the Rundreise or Tourist system, which affords travellers choice of route and a reduction of about 30 per cent. off ordinary fares.

NOW READY,

PROUT'S CONTINENTAL SKETCHES

Proofs on Thick Plate Paper in Handsome Portfolio, Cloth, Gilt Lettered, Size 21 inches by 15 inches, Price 42s. Net.

The work consists of 75 Plates, and was originally published at 30 Guineas. The Plates are the full size of Prout's Drawings, and are an exact reproduction by the

PERMANENT INK PHOTO PROCESS.

Mr. RUSKIN, Author of "The Seven Lamps of Architecture," &c., &c., referring to these Drawings, says :—

"Prout ransacked every corner of France, Germany, the Netherlands and Italy."

"Prout was, and he remains, the only one of our artists who entirely showed Turner's sense of magnitude; and of all forms of artistic susceptibility reverent perception of true magnitude is the rarest.

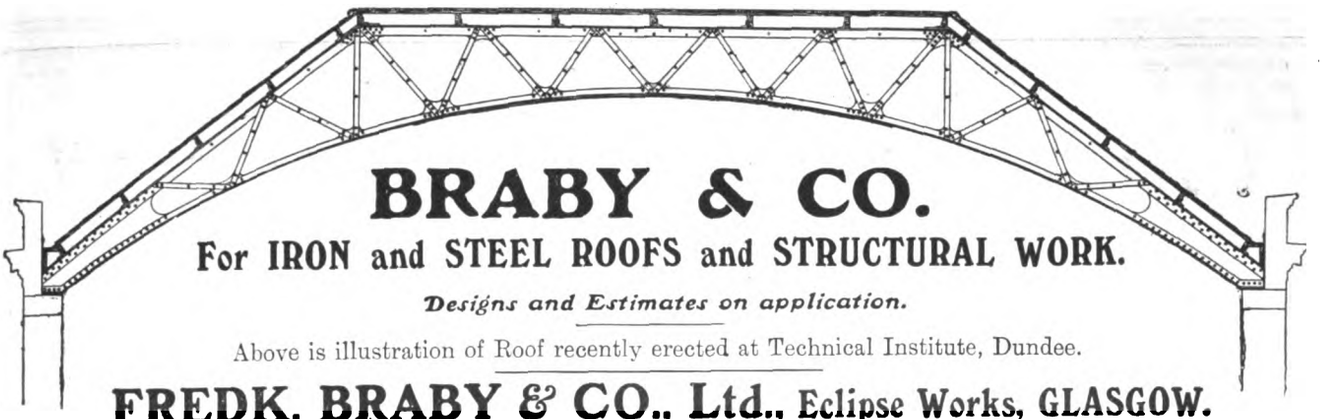
"Numerous as have been his imitators, extended as his influence, there has yet appeared nothing at all to equal him; there is no stone drawing, no vitality of architecture, like Prout's."

"His 'On the Grand Canal, Venice,' is an Arabian enchantment, his 'Street in Nuremberg' is a German fairy tale."

"Prout drew every lovely street in Europe."

"I have," says Mr. Ruskin, "both in my earlier books and in my lectures at Oxford, spoken of the sketches of Prout with reverence and enthusiasm."

"The sharpest photograph is not half so natural."



"No architect, however accurate in his measurements—no artist however sensitive in his admiration—ever gave the proportion and grace of Gothic spires and towers with the loving fidelity that Prout did. This is much to say; and therefore I say it again deliberately, there are no existing true records of the real effect of Gothic towers and spires—except only Prout's."

May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON'S Bookstalls, or from the

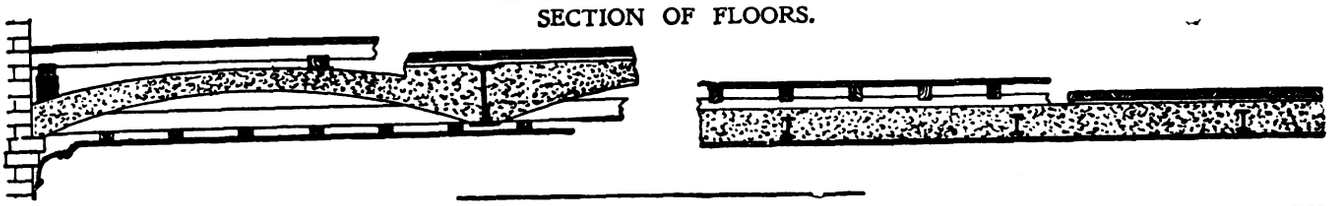
For IRON and STEEL ROOFS and STRUCTURAL WORK.

Designs and Estimates on application.



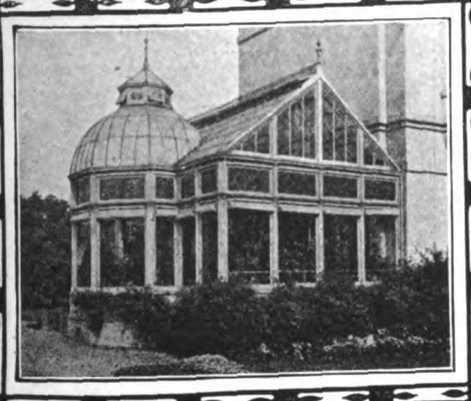
Above is illustration of Roof recently erected at Technical Institute, Dundee.

FREDK. BRABY & CO., Ltd., Eclipse Works, GLASGOW.

DENNETT'S FIREPROOF CONSTRUCTION.

As Patented in Great Britain, Canada, and the United States.

SECTION OF FLOORS.



THIS method of construction has been found to be most **ECONOMICAL, EASY OF ADAPTATION,** and possessing great **STRENGTH, RIGIDITY,** and highly **FIRE-PROOF** character. It has been subjected at various times to severe tests, and is now generally adopted by the first Architects of the day.

TESTIMONIAL.—"I have made use of Messrs. Dennett & Co.'s material for Fireproof Arching, and though I have, happily, had no practical experience of its efficiency as against fire, I can bear witness to its strength, and its extreme convenience of application. **I have made use of it in positions in which I should have found it difficult to introduce any other fireproof material**; and it has this advantage, that the arches constructed of it are so entirely in one mass that they cover the space like a compact shell or inverted basin, and are, consequently, almost wholly free from lateral pressure."—GEO. GILBERT SCOTT, 20 Spring Gardens.

DENNETT & INGLE,

24 QUEEN ANNE'S GATE (late 5 WHITEHALL), LONDON, S.W.; STATION ST., NOTTINGHAM.

Drawing, Estimates, and full particulars will be furnished without charge by the Patentees on application to either of the above Addresses. Rough Sketches or Tracings or Plans should accompany the application

MODERN GLASSHOUSES,

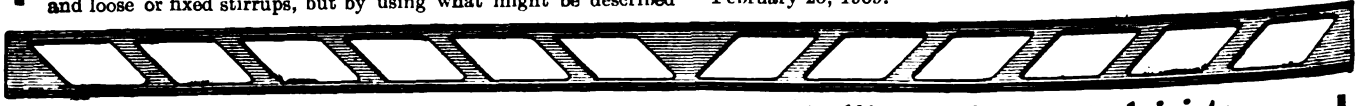
120
120

Or about 2′ 9″ to 2′ 10″ Centres.



Mon'lithcrete Girders in combination with Concrete are safer than Reinforcing Bars.

"The general results of the tests must certainly be considered as highly satisfactory, and as substantiating the claims put forward on behalf of this method of floor construction in respect of strength and rigidity."—THE BUILDER, February 20, 1909.

"It is claimed for this system of construction that it provides the same safeguard against the expansion of concrete as does the use of reinforcing bars, and this seems to be a justifiable claim, considering how perfectly the concrete is held by passing through the webs of the joists."—THE BUILDING NEWS, February 12, 1909.

"The aim of the inventor, Mr. Mark Fawcett, has been to obtain monolithic construction not by using concrete reinforced by bars and loose or fixed stirrups, but by using what might be described as lattice girders from which the compression members have been removed; in other words, rolled steel girders with large rhomboidal-shaped openings in the webs and tension bars pitched at an angle of 45° to the right and left of the centre, leaving the webs solid at each end to resist shear, whilst the top flanges are reduced to two-thirds the sectional area of the bottom flanges.

"The result is that the steel beams, reduced in weight 40 per cent. from the British standard, are capable of carrying at least 50 per cent. more load. The new floor has besides the advantage that an aggregate, as broken brick, can be used for the concrete, possessing greater resistance to fire and less conductive of sound than ballast concrete ordinarily employed in reinforced work."—THE ARCHITECT, February 26, 1909.

Mon'lithcrete Girders have known strength like ordinary steel joists.

Printed by SPOTTISWOODE & CO. LTD., at No. 5 New-street Square, E.C., and Published for the Proprietors by P. A. GILBERT WOOD, at the Office, Imperial Buildings, Ludgate Circus, London, E.C.—*Friday, April* 16, 1909.

WREXHAM.—April 27.—For alterations and additions to goods shed for the Great Western Railway Company. The Resident Engineer, Birmingham Station.

THE Blackburn Town Council have decided upon a scheme to cost 113,000*l.* for the utilisation of the Blakey Moor site, which was acquired for 80,000*l.* Buildings, to include police headquarters, a sessions house, police courts, a large public hall and smaller assembly rooms are to be built. The Corporation already possess borrowing powers for the building of police quarters, but the consent of the Local Government Board will have to be obtained before the erection of the public hall is begun.

AT the monthly meeting of the Riccall Rural District Council, Yorks, a letter was read from Messrs. Gelder & Kitchen, architects and surveyors, of Hull, stating that Messrs. Watson & Sons, soap manufacturers, Leeds, were about to erect a large oil mill at Selby, and they on a later date would submit plans to the Riccall Council for confirmation. As the firm were very anxious to proceed with the work the architects had advised them to put in the foundations during the period that they were preparing plans, getting the contract let, and plans approved by the Council. The architects said they had written to the clerk so that there might be no disrespect shown in proceeding with the foundations. The Council approved of the architects' action, and agreed to the foundations being put in pending the production of the necessary plans, the members expressing pleasure in helping forward the project.

Crispin & Sons, Bristol (*accepted*)	£2,345 0 0

Ayr Dean of Guild Court have passed plans for an entertainment and roller-skating pavilion to be erected at Boswell Park, Ayr. The buildings, which have been designed by Mr. J. Campbell Reid, A.R.I.B.A., Glasgow, are to be constructed of white fibre plaster, with steel-girder roof and patent roofing material, and the estimated cost is 3,000*l*.

The question of English *versus* German contracts created a scene at the meeting of the Spalding Urban Council recently. A committee reported in favour of paving in the town being done with German material under the direction of a German foreman, on the ground that it was cheaper than English work. After a heated discussion, it was agreed that the work should be done by English materials and labour, the German proposal being negatived.

The Swansea sub-property committee recommends the acceptance of the tender of Messrs. Lloyd Bros. for the erection of the Glyn Vivian Art Gallery. There were altogether eleven tenders. The contract price is not yet made public, but it is stated it is below the sum of 10,000*l*., which Mr. Vivian has promised to give for the erection of the building.

TRADE NOTES.

Farrow & Jackson, Ltd., of 16 Great Tower Street, E.C., and 8 Haymarket, S.W., and 91 Mansell Street, E., announce that they have just registered "Farjak, London," in substitution of "Farrow-Jackson, London," as a telegraphic address, thus saving one word in the message.

Sanitarians teach us that many serious diseases are preventible, among them typhoid fever, cholera, diphtheria, &c. They are made preventible through our knowing the sources whence infection comes to us. Drinking water is liable to constitute a source of disease, and especially of typhoid fever itself. Cholera has been abolished by watchful care over public water supplies, but typhoid fever and diphtheria still remain with us. The ensuring that our drinking water shall be pure and free from all chance of conveying disease germs to us is therefore at once a plain and effective mode of arresting disease attack. Whenever any water is suspected to be of a suspicious character, it should be filtered, but proper filtration is one thing, and partial and ineffective filtration quite another thing. There is only one road of safety in this important matter, namely, to use a filter which has been tested and approved by scientists (Dr. Sims Woodhead, Dr. Andrew Wilson, and others), and which has been proved to yield a water absolutely germ-free. Such filters are those made by the Berkefeld Filter Company, 121 Oxford Street, London, W. All interested in the subject of pure water should send for the literature of the Berkefeld Filter Company, which will be sent free on application.

The Manchester City Council last week approved of proposals to construct baths for Withington at a cost of 20,000*l.*, and a municipal school at Fallowfield to cost 13,400*l.*

Mr. Richard D. Batchelor, artesian and consulting well engineer, of 73 Queen Victoria Street, E.C., and Chatham, has been awarded the contract for a large boring 1,000 feet deep for the water supply of the Lewes Union, Chailey, Sussex.

BUILDING TRADES EXHIBITION.

The wisdom of Mr. Greville Montgomery, when he boldly transferred the Building Trades Exhibition from the Agricultural Hall to Olympia in 1907, was amply shown by the results. The change from Islington to Kensington was a proof of the growing interest, both technical and non-technical, in these displays. That interest could not fail to be fostered when the exhibits were brought to so central a position and so admirable a rendezvous as Olympia, and thereby the public and the trade were mutually benefited. Among those professionally concerned with building these biennial exhibitions have for some time been looked forward to keenly and have attracted large numbers from all over the country and even from abroad. Of late the circle has been widening until that expectation is now shared by those who are the essential complement of the building trade—*i.e.* the general public. On each successive occasion the standard of the exhibition has been raised and is made more and more representative, until now it is almost impossible to learn everything that is to be learnt in a single visit. The various societies that have already arranged special visits show the truth of what has been just said. It will be found that the Building Trades Exhibition of 1909 is one step in advance of any that have gone before, and that in itself is no easy achievement.

We give a few preliminary notices of what will be seen when Olympia is declared open to-morrow (Saturday) by Mr. Ernest George, F.R.I.B.A.

The stand of the *British Uralite Company (1908), Ltd.* (No. 215, Row N annexe), consists of a building, 20 feet by 16 feet, in imitation of old-fashioned half-timbered work, this effect being produced by means of narrow strips of dark-coloured asbestone fixed at intervals on the surface of the flat asbestone sheets forming the walls. The whole building shows the adaptability of the company's manufactures for the construction of bungalows, &c. The walls are of asbestone sheets, 6 feet by 3 feet, nailed direct to wood framework, one part being arranged to show a plain flat surface inside, similar to plaster, and the other panelled

out with moulding. The ceilings are of uralite sheets, part fixed direct to ceiling joists to form a plain flat ceiling, and the remainder fixed above the ceiling joists, thus obtaining the effect of an old-fashioned timbered ceiling. The roof is laid with asbestone diagonal tiles on battens, with the exception of the dormer, which is covered with 12-inch by 8-inch asbestone slates. The dwarf partition on view is composed of the new uralite fireproof plaster slabs now being placed on the market by the Uralite Company. It may be mentioned that while these partition slabs are among the cheapest on the market, they possess the excellent fire-resisting qualities of uralite.

The *Art Pavements and Decorations, Ltd.*, exhibit at Stand 104, Row F, comprises mosaics, marble, wall and floor tiles, parquetry and block flooring, and Armadek composition flooring. In the marble section are nearly

100 varieties of coloured marbles suitable for all descriptions of decorative work. They include Siberian green (recommended for walls and floors owing to its hardness, durability and rich marking), Calacata (a white marble with delicate grey veins, very suitable for panelling walls), and Listavenna (a white marble with light-green veins), and many other varieties. The effect is shown of various marbles in combination. This part of the exhibit is completed with steps and risers in statuary and Sicilian marble. The mosaic section includes samples of Roman, terrazzo and breccia mosaic. In the parquetry section are various patterns in oak, walnut, mahogany and teak; and in the wood-block flooring department in deal, pitch pine and oak floors. The Armadek composition flooring forms a jointless, fireproof and sanitary floor at a low cost. This material can also be used for dados and carried up from the floor with a cove skirting. In the tile section are shown a specimen lavatory and two bathrooms lined with dull glazed Medmenham tiles. These tiles have been produced to meet the demand for tiles free from a highly glazed surface. The exhibit further comprises wall tiles suitable for hall or staircase, a large range of dados in antique enamelled tiles, and chimneypieces with surrounds in Medmenham tiles. The border to this part of the exhibit is laid in a new hydraulic tile with grooved non-slipping surface, suitable not only for floors of factories, &c., but also for treads of staircases, gangways, paths, swimming-baths, &c.

James Latham, Ltd., 124 Curtain Road, E.C., have secured larger space than in 1907, and need it to show very finely figured mahogany, oak, walnut, ash, satinwood, teak, kauri pine, maple and pine, &c. The four latter items show that our Colonies are not left out. High-class home-grown timber, such as oak, walnut, beech, sycamore and brown oak, &c., are represented by excellent examples. The sample of English oak is from a tree which was 4 feet through the centre 6 feet from the ground and from 250 to 300 years old. The walnut is about 150 years old, and the brown oak sample about 700 years old. It may here be mentioned that Messrs. J. Latham, Ltd., recently handled a parcel of this latter wood from trees which formed part of an avenue in the Midlands which is mentioned in Domesday Book as being a well-grown plantation then, so the wood must have been at least 1,100 years old. Mouldings, floorings, hand-rails, &c., in mahogany, oak, teak and American whitewood, form a strong feature of the exhibit. They are of good design and excellently machined. Hardwoods are finely represented in the samples of veneers, both sawn and knife-

cut. One of the features of Stand No. 260, Row R, will be actual specimens, growing in pots, of many of the woods used in the trade, such as oak, walnut, ash, beech, maple, pine, &c.

The *Associated Portland Cement Manufacturers (1900), Ltd.*, Stand No. 63, Row D, again afford visitors a complete insight into the manufacture, testing and possible uses of Portland cement. There are shown the raw material, with specimens of the upper chalk formation, and clay from the estuary of the Medway and from the company's own deposits in Kent. Samples of slurry, representing the mechanical mixture of the raw materials in definite chemical proportions and thoroughly incorporated, are on view. Also a large quantity of 1-inch section briquettes of various ages, to be tested for tensile stress in the course of the Exhibition. The standard method of gauging briquettes, pats for setting time, and making tests for constancy of volume under the conditions in the standard specification are also shown. Crushing tests of 2¾-inch cubes, consisting of neat Portland cement and a mixture of three of standard sand to one of Portland cement, are made, and various aggregates, both suitable and unsuitable for mortar and concrete work, are given. The company's business in plaster of Paris, Keene's, Parian and Roman cements, is represented by samples of each, and mouldings made with their superfine Keene's cement mixed with various colouring oxides. The useful handbook, "Everyday Uses of Portland Cement," is on sale at this Stand. It is (as we mentioned some few weeks ago) well got up, profusely illustrated, and affords much information to users of Portland cement generally. The Stand itself contains photographs of notable undertakings in different parts of the world in which the company's brands of cement have been used.

The *Oakeley Slate Quarries Company, Ltd.*, of Blaenau-Festiniog, North Wales, and 53 Parliament Street, S.W., show at Stand No. 97, Row F, a fine specimen of random slating executed by Mr. John Macquire, of 108 Southwark Park Road, S.E.; there are also excellent examples of slabs, with specimens of slates from the finest to the heavier qualities. Some of them have been on roofs before the year 1803, and there are also slates from an old smithy where they were exposed to sulphurous fumes for over seventy years. These two exhibits effectively demonstrate the endurance of the Oakeley old-vein rock. These slate mines have been working for upwards of 200 years and are among the largest in the world; operations are carried on at twenty-six floors or levels, of a depth from top to bottom of 1,400 feet; and there are over forty miles of rails and tramroads on the property. Upwards of 4,000,000 tons of their finished roofing slates have found markets in parts of the world varying as widely as Russia and West Africa, and from 1888 to 1906 no less than 14,000,000 tons of slate rock and waste were quarried. The works throughout are electrically equipped on the three-phase system. This exhibit affords an opportunity to inspect the process of roofing-slate manufacture without a journey to the quarries in North Wales.

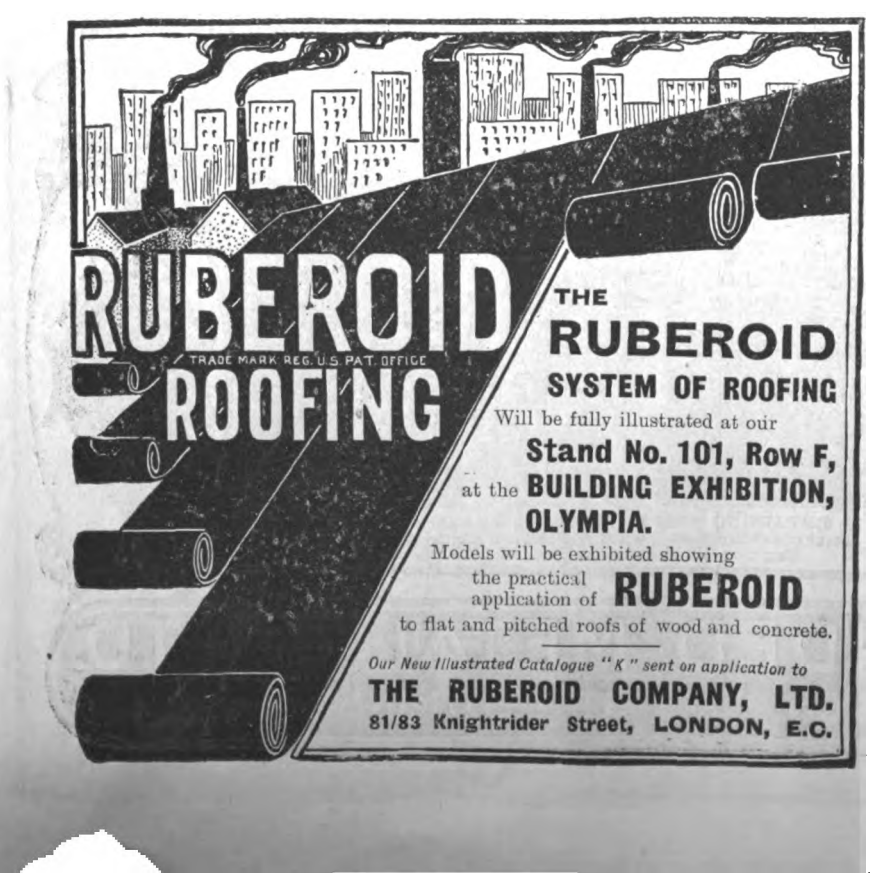
Hall's Distemper exhibit (Stand 75, Row D) is intended to demonstrate some of the possibilities of decoration with various paint and distemper specialties of *Sissons Bros. & Co., Ltd.*, of Hull and London. The exhibit takes the form of a cottage with porches, and contains a completely furnished living-room and bedroom, and has been designed by Mr. T. Gordon Jackson, architect, of 2 Broad Street Place, E.C. This scheme can be easily adapted to any permanent building, and advice will be gladly furnished. The decorations employed are as follows:—Externally the rough-cast walls are coloured with Hall's distemper (cream colour No. 17, outside quality); the roof, which is of weather boarding, is coloured with Hall's distemper (outside quality No. 9); the wood framing is treated with green oil paint (Aperfectol No. 129); while the gable timbers are treated with Rustikol, a cheap preservative stain for outside woodwork (dark oak); the doors and window frames are finished in white enamel (Sisco white Japan). Internally the living-room has an attractive scheme, in which the walls contrast

Digitized by Google

well with painted and stained woodwork; the walls are coloured with Hall's distemper (No. 77, flamingo red); the posts and beams are stained with Sissons' (dark oak) turpentine stain; while the doors, skirtings, seats, &c., are finished in white enamel (Orientolac). The furniture is in Sissons' (dark oak) turpentine stain, which reproduces natural woods with one coat and costs 75 per cent. less than grainwork. The bedroom is in a restful tone of blue, and the walls are coloured with Hall's distemper (No. 47). The woodwork (except the posts and beams) is finished with Sisco white japan, an elastic enamel. The furniture here is stained with Sissons' mahogany turpentine stain. In the back porch are shown a number of the firm's actual decorative specialties.

The *Saxon Portland Cement Company, Ltd.*, Cambridge, show samples of the constituents of their cement, from the time the chalk and clay deposit is excavated until it is ready for use. The exhibits commence with the raw material, which contains from 15 per cent. to 25 per cent. of clayey matter and an average of 79 per cent. of carbonate of lime. As the proportion of lime varies considerably, the ground marl is first dried and put through a mixer to ensure a uniformity of the lime and clay before it is made into blocks and loaded into kilns. But when the rotary kiln is used the marl is burnt in its powdered state. Samples are given of each of these, as well as of the clinker that results from the two different kinds of kilns. The next sample in chronological order is that of the clinker after passing the first stage of the crushing or grinding process. The final stage shows Saxon cement as powder, and consisting of about 60 per cent. of absolute "flour" (the cementitious part of the material). It has an average fineness such as to leave only 1 per cent. on a sieve having 5,800 holes per square inch. The output of the Saxon and Norman Works is 100,000 tons per annum, and the company guarantee its uniform excellence.

Messrs. W. Oliver & Sons, Ltd., of 120 Bunhill Row, E.C., are, as usual, showing specimens of the best quality seasoned hardwoods fit for immediate use, both in the rough and polished. One specialty is a very fine six-bevel panel Cuba mahogany entrance door with carved wooden frame; they are also showing various hardwood floorings of the highest quality. It may be here mentioned that on the occasion of the visit of the Prince of Wales to the 1907 Exhibition, his Royal Highness, on expressing a wish to see some New Zealand timber, was conducted to the Stand of Messrs. W. Oliver & Sons. Their exhibit is always a source of pleasure to anyone who can at all appreciate high-class timber. Many parts of the world are represented in it.



Stand No. 219, Row N, is held by *George Wooliscroft & Son, Ltd.*, of Hanley, who make a fine display of constructional faïence, terra-cotta, red and blue goods and a large variety of tiles. The front of the Stand shows their different kinds of faïence and terra-cotta work to advantage. Inside there is a choice selection of modern fireplaces on the floor-level principle, including the glow, quadrate and patent down-draught. The last named is provided with an additional flue for the purpose of burning anthracite coal in the open grate. Harmony reigns in these fireplaces, for the surrounds, the mantel and the curbs are all of slabbed tiles or faïence. On the floor are specimens of tesselated and ironstone adamant tiles in many designs. Slabbed tile panels and wall and dado tiling are arranged round the walls. Attention is called to the patent grip back tiles, as supplied for the underground electric railways of London and other important contracts. The tiled-top oak tables, for hotel and restaurant use, combine beauty, sanitary advantages and strength of structure. The roof tiling shows a wide variety of colour and finish, comprising the gradations of tone from fast red to blue, and includes handmade sand-faced Aspera and Grip roof tiles, the latter doing away with the necessity of nailing. Red and blue Staffordshire goods for all purposes and antique and fancy glazed tiles are also displayed.

The "Devon" fire of *Candy & Co., Ltd.*, has to live up to a high reputation ever since it was placed equal first in the official tests carried out some three years ago jointly by the Office of Works and the Smoke Abatement Society, under the direction of Sir Henry Tanner. The results were so satisfactory that they may be again mentioned. During thirty-two hours the "Devon" fire consumed 20.43 lb. of coal, against the 27.92 lb. which was the average of the thirty-six other grates, while the heat was 4 per cent. higher and the smoke 25 per cent. less than that

of the others. This last fact is of itself a powerful recommendation, and was probably overlooked by Sir Aston Webb, R.A., when he expressed his opinion that coal will be superseded by electricity in fifty years because of the latter's smokeless heating powers. The love of the fireside is implanted too deeply in the national mind to be easily eradicated, and there will be no need for any drastic change while such firms as *Messrs. Candy & Co., Ltd.*, are able to combat the smoke evil by their application of scientific knowledge to the cheerful open grate. Perhaps this advantage may not have irresistible attraction for the architect's or builder's client, but what cannot fail to attract him is the gain in heat and reduction in the coal bill; and all these can be enjoyed in grates of great artistic charm which can be had in designs suitable for any style of building.

During their 110 years of existence *Messrs. Shaw & Carter*, of Birmingham, must have witnessed many changes in their business as lock manufacturers and brass and bronze metal founders. Among their numerous patents is the "Shawcar" patent adjustable tubular hat and coat hooks; they are cheap, strong, compact (the projection of each hook from the centre is 3½ inches), and are easily fixed on to the tube by two bolts, which also secure the wire panels in the rebates. The firm sell a series of indestructible adjustable hooks fixed by screws. The "Shawcar" anti-friction ball-bearing lock carries with it a guarantee for wear during twenty years, and the makers undertake to repair any lock returned through faulty workmanship. Hardened steel balls are applied in a revolving bronze or brass cup to the latching action, which is operated by the follower, made of hardened steel. Another anti-friction patent is their double ball-bearing axle-pulley, in which the balls take a bearing on the wrought-steel cheeks and spindle so as to prevent the wheel from binding on the cheek and to secure perfect running. Messrs. Shaw & Carter, it is needless to add, are able to supply all kinds of door furniture and other fittings which play so important a part in a house in creating an impression. They have an improved casement-stay and a patent automatic rain and draught proof water bar for the top rail of wood casements and fanlights.

B. Finch & Co., Ltd., are, if we remember rightly, newcomers to the Building Trades Exhibition; they certainly have not been included in the last two or three. Their sanitary appliances may consequently be extended a genuine welcome, for although in the past numerous English makers of the same lines have ably demonstrated the vast improvements made in sanitary goods, yet it is well that the general public should realise how many firms now pay special attention to hygiene. One of B. Finch & Co.'s contributions is the "Weir" lavatory. In this they do away with the primitive immovable overflow opening, and replace it with a cylindrical recess at the back of the basin well below the top rim. The overflow passes down this chamber (which is large enough to admit the hand with a sponge for cleaning) and through a grating at the bottom. This weir can carry off water supplied under pressure from the largest lavatory valves, and at each discharge the overflow chamber is automatically flushed, the water escaping through the grating. For schools, &c., the "Weir" lavatories can be obtained in table ranges. Messrs. Finch also show surgical lavatories, a bath shower worked by a single lever, and a "Silent Facile" closet, for use where there is not enough room for the ordinary water-waste preventer with flush pipe. The water is silently discharged by the gentle pressure of the button and then silently fills.

Mellowes & Co., Ltd., sanitary engineers and specialists, Sheffield, are showing some first-class sanitary fittings, including new models in w.c.'s and lavatories. One of these has a w.c. basin with a specially large water area and is without mouldings, for cleanliness. By the new process the highly finished earthenware looks equal to heavy fireclay. There is also a new lavatory made in the same process and which likewise has a specially large plain basin, while the price is very low considering the quality. They are also showing first quality bath, with 4-inch roll-edge, with and without a needle and shower bath fixed through the roll. Special attention is called to the plumbing work executed by their workmen, which includes special joints constructed in vertical lead waste-pipe for expansion. This allows stacks of pipes to remain perfectly perpendicular. Messrs. Mellowes are willing to prepare schemes, with estimates, free of charge, for drainage, plumbing, heating work, water supplies, &c. They are also makers of and exhibiting the "Eclipse" patent roof glazing bar, which consists of a steel

core entirely surrounded by a lead sheath, on each side of which are three webs, the first two being rubbed down on to the glass from the outside and the third rubbed up to the glass from underneath. A perfectly watertight joint is thus formed between the glass and the lead, and no paint or packing of any description is required. Rusting of the bar is prevented by the strong lead cover soldered up at each end. It is adaptable to all roofs, also to domes, screens and window glazing. Breakage of glass from expansion or contraction is rendered impossible by the bead on the bar. "Eclipse" glazing is guaranteed watertight for a term of years.

Hartley & Sugden, Ltd., of the Atlas Works, Halifax, wish visitors to Stand 123, Row G, to pay special attention to the Series K and H of their cast-iron sectional "White Rose" boilers, which, being provided with a higher feed-door, can take in a very large quantity of coal and will burn for a long time without attention. There are two new boilers in the cast-iron "Sentinel" and new "Gas" boiler. The "Sentinel" is for small greenhouses and other cases where a quantity of fuel has to last through the night and yet only a small fire is required. This boiler is low in price as well as economical in working. The cast-iron "Gas" boiler is also inexpensive, and exceedingly handy where a small apparatus is needed for heating an office or single room. Some of the types of boilers that have made this firm's name familiar to thousands of people, such as the "Savile" for domestic supply, the "Chatsworth," the "Halifax" and the "Effective" are shown on the Stand. The radiators are of both plain and fluted patterns.

The exhibit of the *Trussed Concrete Steel Company, Ltd.*, is of value to all interested in reinforced concrete. Prominent is a small model plant showing the manufacture of the Kahn trussed bar, which is owned by the company. During the Exhibition model bars will be given away. A practical exhibit is a model wooden beam, demonstrating the comparative value of rigid shear members (as shown by the Kahn bar) and loose shear members. The beam shows the practical impossibility of failure by shear when rigid members are used. Another exhibit is a model reinforced concrete beam, which enables the onlooker to see how the concrete packs itself around the diagonals of the Kahn trussed bar at the point of juncture with the main bar. To architects considering the advantages of reinforced concrete for lintels, the model lintel shown is of much interest, and also to any builders desirous of finding cheaper methods of lintel construction than rolled steel joists. A beam is also exhibited to prove that Kahn trussed bars, when embedded in concrete, do not depend upon adhesion. Engineers start with the assumption that the reinforcing steel in a concrete beam must be thoroughly embedded in order to derive its tensile stress by the adhesion of the concrete to it. This is true if loose shear members are used. However, in the test referred to the main tension bar is not embedded in the concrete, the shear members alone running up into the mass. The test beam is, of course, of a purely academic nature, and is only designed to show that the fundamental principles of the Kahn bar differ from every other. The exhibit includes photographs of works under construction, sample bars of various sections, the Ideal pile for repair work, and model tanks showing a new method of making concrete waterproof.

The *Expanded Metal Company, Ltd.*, again show examples of some of the widely differing uses to which the material is put. But there must necessarily be many omissions, for to make it fully representative the exhibit would have to include sea-defence works, reservoirs, bridges and other large undertakings. What is actually shown is examples of expanded steel-concrete fire-resisting flooring, roofing and walling, expanded steel-concrete retaining walls, sewers, conduits, &c., and expanded metal lathing and plaster partitions, ceilings, steelwork encasing and so on. The material is turned to domestic account as well in such made-up goods as workmen's lockers, builders' screens and riddles, workshop divisions, fencing, &c. Expanded metal is a material that no architect or engineer can afford to ignore, and the Stand is certain to attract as much attention as any of its predecessors at these Exhibitions, which is equivalent to saying that it will be a general object of interest to visitors, both technical and non-technical.

The *Kleine Patent Fire-Resisting Flooring Syndicate, Ltd.*, are the staunch champions of bricks for use in fireproof floors. Rectangular bricks (solid and hollow, according to the load) are laid, with thin iron tension bands placed on edge and inserted in each joint. By using hollow bricks the

dead weight of the floor (over short spans up to 9 feet) is not more than 25 lb. per foot super. The width of the spans without joists may be as much as 22 feet; but for big loads the greatest practicable width is 12 feet. The floors can be constructed at almost any speed desired, the centring is removed after a few days and the brick soffit is ready for plastering. The accuracy of the calculations on which these floors are constructed is proved by the fact that although millions of square yards have been in use during the last fifteen years, no "Kleine" floor has yet collapsed. Roofs

and staircases as well as floors are carried out on this system. Mr. W. Noble Twelvetrees some months ago carried out fire, water and load tests on three types of floors. His conclusion was that "the results of the tests prove conclusively that all three floors behaved in a perfectly satisfactory manner, the resistance of the construction to fire and water leaving nothing to be desired. The behaviour of Floor A was particularly noteworthy in respect of its fire-resisting and load-bearing capacity, after exposure to thermal influences and strains more severe than those obtaining in actual practice."

The *Maximum Light Window Glass Company* are demonstrating the effects of the "Maximum Daylight Glass" for increasing the daylight in buildings; the "Cat's Eye Glass," the new product made for partitions, door panels, &c.; and "Max Silk Glass," a new design in figured rolled glass. Any glass that can substantiate its claim to increase the light passing through windows from 500 to 2,000 per cent. may well claim to be called the "Maximum." The glass is made in sheets 100 inches by 40 inches, of various tints. The "Cat's Eye" is a new type of rolled glass chiefly used for obscuring the view without detracting from the light.

Sam Deards is acting as sole agent and manager for Smale's duplex block-making machine, which can be seen at Stand No. 2, Row B. The machine is called "the Rapid," and it can turn out, we are told, "concrete blocks, 18 inches by 9 inches by 4½ inches (equivalent to seven stock bricks), at the rate of two a minute, 120 an hour, or over 1,000 a day, at a cost of materials and labour of less than 1½*d.* each." At this rate it should certainly be possible to complete a six-roomed cottage in a single month, including the ten to fourteen days during which the blocks are setting. These machines may be either hired or purchased.

The *Well Fire and Foundry Company, Ltd.*, have made and sold no less than 100,000 of their patent fires, and these have been installed in such buildings as Caxton House, Westminster; the British Medical Association, W.C.; Lancaster City Hall and the Bradford City Hall. Some idea of the multiplicity of designs employed may be obtained by London architects from a visit to the very commodious showrooms at 33 Dover Street, Piccadilly, or by provincial practitioners at the local showrooms in Edinburgh, Manchester and Liverpool. The company produce excellent wood chimneypieces, as well as the general artistic setting to their fires, so as to ensure a worthy frame to their patent. Kitchen ranges and sanitary fittings are another feature of their activity. Their Stand may always be calculated upon to afford general interest to visitors.

For the vacant office of surveyor and sanitary inspector under Heath Town District Council there are seventy-five candidates. The Local Government Board have suggested that in consequence of the rapid growth of building operations and other work the two offices should be separated, and therefore different appointments made.

HOLLOW CONCRETE BLOCKS.

ALTHOUGH solid concrete blocks were made by machines as much as thirty years ago, it is only within about the last seven that hollow blocks made their entry into the world of construction. The *début* could not strictly be called a triumphal one, for the hollow block did not at first find much wider favour than was accorded to its parent. One potent reason was that the pioneers relied too much on the structural advantages and ignored the æsthetic possibilities. It was granted by all that the ordinary concrete block was eminently adapted to buildings in which strength and fireproof qualities were most desirable; but something more than this was expected of a private residence. This demand was scarcely answered when the concrete outer walls were covered in with a shingle roof and rendered "tasty" by wooden "trimmings," for the new fireproof character of the house was at once stultified. Of course, it was not long before various efforts were successfully made to meet the wishes of possible patrons, and now the prejudice against this type of construction is gradually dying down. It was inevitable that the effects of stone and bricks should be imparted to so plastic a material by a manipulation of the moulds or by tooling the face of the blocks.

Among the companies dealing in this system is the Building and Estates Development Company, Ltd., Bristol. By their machines the walls are built *in situ* section by section and course by course from 6 inches to 2 feet in thickness at one operation. In an ordinary 9-inch wall there is one cavity, in a 14-inch wall two cavities, in a 19-inch wall three, and in a 24-inch wall four cavities. The process of construction may be described in the company's own words:—"Our machine commences at the bottom of the building and works its way round and round until it reaches the top, leaving the walls in one mass." The Building and Estates Development Company, Ltd., are prepared to carry out orders for any description of building both great and small.

MR. ERNEST OCTAVIUS LARKE, of Bromley, Kent, and of Tenter Street, Moorfields, London, E.C., builder, who died on May 10 last, left estate of the gross value of 31,904*l.* 17*s.* 7*d.*

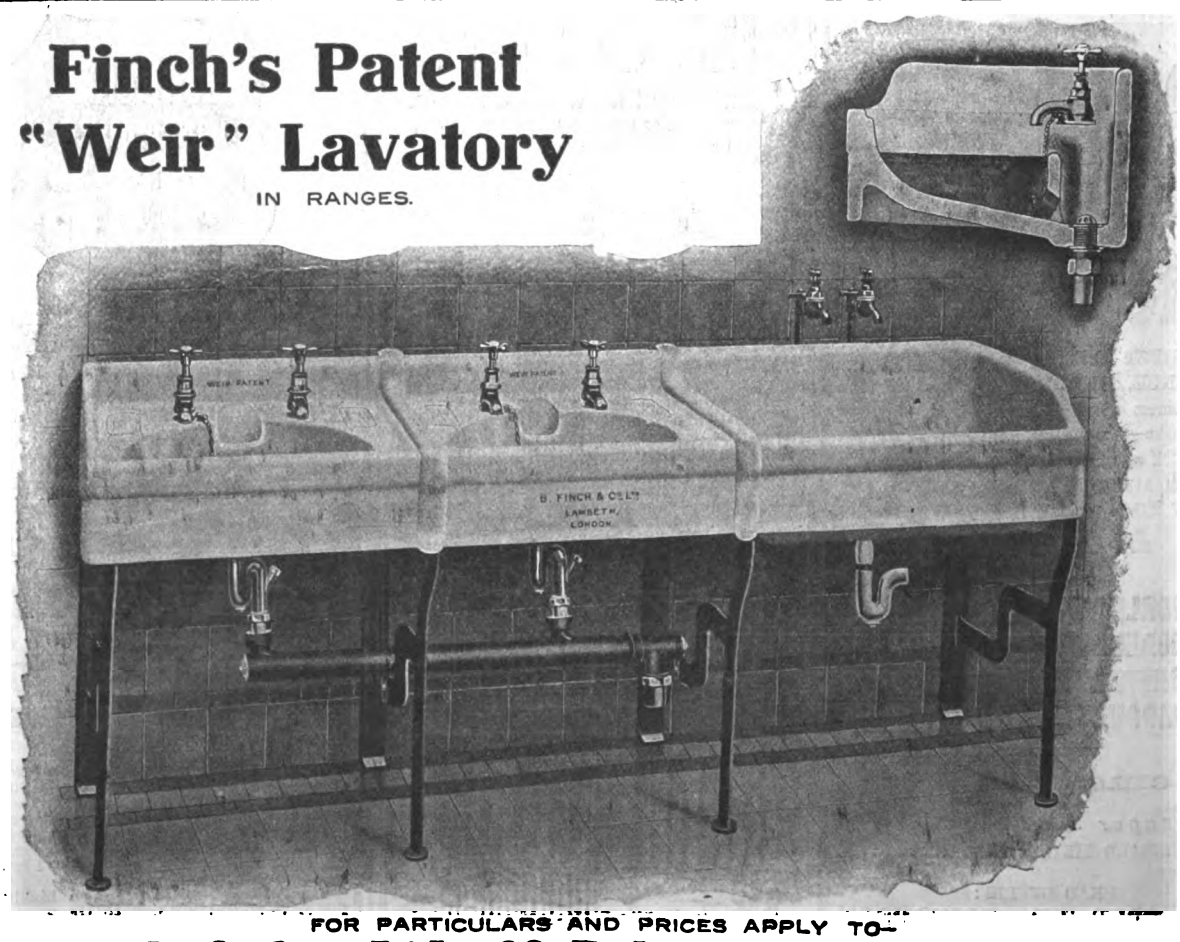
VARIETIES.

PENMAENMAWR, in Wales, is to be advertised at the Imperial International Exhibition by means of a model of the town and surroundings at a cost of 75*l.*

A FIRE broke out in the scutching-room at the Heron Mill, Hollinwood, on Wednesday, and was speedily extinguished by the "Titan" sprinklers with which the mill is fitted up. The fire brigade were not required.

THE Pontefract Town Council have resolved to erect a school, which will be the first Council school in the borough, for the accommodation of 400 boys and girls and 200 infants, on a site to be selected in the western portion of the town.

THE Local Government Board have given sanction to the Bacup Corporation to borrow 27,770*l.* for the purposes of electrification and reconstruction of the tramways in the borough. The work of relaying the tramway permanent line is to be pushed on with all possible speed.



THE Local Government Board has sanctioned the Wallasey District Council's application to borrow 15,750*l.* for the purchase of the New Brighton golf links. The purchase of the links is a step towards the extension of the Wallasey promenade in the direction of Wallasey village.

A PURIFICATION scheme costing about 7,000*l.* has been adopted by Johnstone Town Council. The new scheme is intended to focus all drainage in Johnstone and eliminate all impure matter so as to save the Cart from contamination as a contributory to the Clyde. This scheme has been before the Council for a considerable time, and the action now taken will remove all complaint.

MR. A. B. M'DONALD, the Glasgow city engineer, at the request of the committee on congestion of population in New York, has prepared two large maps of Glasgow, the one indicating the property of the Corporation, and the other showing topographically the great development of the city since the twelfth century until the present day. The maps are drawn to the scale of 12 inches to the mile.

AN examination for certificates of qualification for appointment of sanitary inspector or inspector of nuisances, under the Public Health (London) Act, 1891, will be held in London on May 4 and the four following days. An examination will also be held at Birmingham in June next, if a suffi-

cient number of candidates apply for examination. Particulars will be forwarded on application to the Hon. Secretary, the Sanitary Inspectors' Examination Board, 1 Adelaide Buildings, London Bridge, E.C.

Professor Henry Adams, M.Inst.C.E., &c., of 60 Queen Victoria Street, London, E.C., has taken his eldest son, Mr. Henry Charles Adams, A.M.I.C.E., A.M.I.M.E., A.M.I.E.E., &c., into partnership in his practice as a consulting engineer and surveyor, under the style of Henry Adams & Son. The Birmingham office is at 1 Waterloo Street. After serving articles to his father some eighteen years ago, Mr. Henry C. Adams acted as a special senior engineering assistant to the Birmingham Corporation and in other public and private appointments.

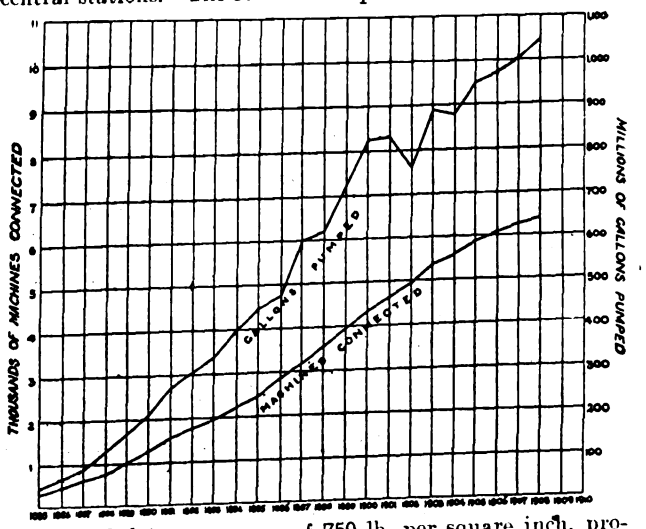
The foundation-stones of the Saltburn-by-the-Sea P.M. church and schools, which are in the centre of the town, were laid on April 12. The block is designed in late Gothic freely treated, a square tower forming a prominent feature at the corner. The facings are in Huncoat pressed red bricks, and the dressings in grey terra-cotta with dragged face. The accommodation in the church is for 500 persons. The contract has been let to Mr. J. G. Porteous, of Guisborough, and amounts to 4,300*l*. The architects are Messrs. G. Baines & Son, 5 Clement's Inn, W.C.

The Gloucestershire County Council on Monday agreed to pay Mr. Robert Phillips, consulting county surveyor, 250*l*. in respect of his work in preparing plans for the extension of the Shire Hall and for superintending the erection of the new buildings. This sum is in addition to the annual 200*l*. a year voted to him for a period of five years in respect of works in hand at the time of resigning the county surveyorship. When informed of the decision, Mr. Phillips remarked it was a very small sum, but he supposed he must accept it. He could not say they had been very generous. At the same meeting tenders varying between 13,857*l*. and 17,370*l*. were received for carrying out the work.

At the last meeting of the London County Council the establishment committee submitted a report with regard to the design of the new county hall. An improved design, which mainly concerned the roof line of the centre block, had been made, and a drawing showing the addition of a turret was exhibited in the lobby. The committee asked the approval of the Council to the alteration. The Rev. F. Hastings moved an amendment calling on the Council to make a model. He criticised the design, and called for something more imposing. This attitude was adopted by various other speakers, but eventually the alteration was adopted.

The Richmond Town Council last week considered plans for the erection of a block of four-storey flats, 58 feet high, upon the site occupied by Ancaster House, next to the entrance to Richmond Park, and opposite to the Star and Garter Hotel. The highway committee recommended the approval of the plans on the ground that they complied with the by-laws. Alderman Sir Charles Burt said that the Council should not approve of this, as it would be very disfiguring to the entrance to the park and detrimental to the town. They had prevented other flats from being built in the neighbourhood. Upon a division the plans were approved.

In July next a party of about 100 Germans interested in garden cities are coming to England, under the guidance of the Garden City Association. The party will be joined by a number of French delegates and an English party. The journey will last from July 7 to 17 inclusive, the last four days being devoted to visits around London. It is proposed to visit the model mining village of Woodlands, the cities of Manchester, Liverpool and Birmingham, the garden villages of Port Sunlight and Bournville, Letchworth (garden city), the garden suburbs of Hampstead and Ealing, the housing work of various municipal and private housing experiments, and social work generally.



HYDRAULIC POWER IN LONDON.

The diagram here shown clearly indicates the remarkable development of the London Hydraulic Power Company's business during the last twenty-three years. In 1886 there were 364 machines served, and the number of gallons delivered per week was 1,271,000; in 1898 the machines had increased to 3,240, and the number of gallons to 11,989,000. During the past ten years this rapid progress has been steadily maintained, until in 1908 there were 6,368 machines in public use, while the water delivered weekly through the

160 odd miles of hydraulic main averaged 19,798,000 gallons. The power available night and day throughout the year is 700 lb. per square inch, and it is employed for hydraulic motors, injector fire hydrants, automatic pumping gear, ejectors, and a vacuum-cleaning system. There are five central stations. The reservoir of power consists of accumu-

lators, loaded to a pressure of 750 lb. per square inch, producing the same effect as if supply tanks were placed at 1,700 feet above the street level. The water is taken from the Thames, the Regent's Canal, and from wells; and all sediment is removed therefrom by filtration before delivery into the mains.

The street mains are laid at the company's expense. The service pipes are charged to the consumer unless a three-years' agreement is entered into. Special mains are laid at the company's own cost if the use of power is guaranteed of sufficient amount. The quantity of water is measured through a meter. All these particulars are given with a view to indicating the ability and readiness of the London Hydraulic Power Company to meet the wishes and requirements of possible customers.

THE UNITED STATES TARIFF BILL.

In the House of Representatives, Washington, Mr. Payne introduced a Bill "to provide revenue, equalise duties and encourage the industries of the United States, and for other purposes." The Bill was referred to the committee on ways and means and has been considered by them, and it is hoped will be finally voted upon this week. The Payne Bill is a minimum and a maximum one.

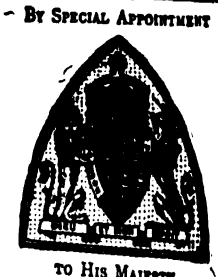
The committee have transferred some articles from the free list to the dutiable, and have increased duties on others, for the sole purpose of increasing the revenue. Most of these articles on which duties have been increased are luxuries. Other articles have been increased because the committee found that there was not sufficient protection under the present law. The tariff on others has been reduced.

Schedule A.

On Paints.

All paints, colours, pigments, including oxide of iron pigment and oxide of iron polishing powder, stains, lakes, crayons or fusains, smalts and frostings, whether crude or dry or mixed, or ground with water or oil or with solutions other than oil, not otherwise specially provided for in sections 1 or 2 of this Act, 30 per cent. ad valorem; all paints, colours and pigments, commonly known as artists' paints or colours, whether in tubes, pans, cakes or other forms, 30 per cent. ad valorem.

Schedule B.—Earths, Earthenware and Glassware.



Brick and Tile.

Firebrick, weighing not more than 10 lb. each, not glazed, enamelled, ornamented or decorated in any manner, 1 dollar 25 cents per ton; glazed, enamelled, ornamented or decorated, 35 per cent. ad valorem; weighing more than 10 lb. each and not specially provided for in sections 1 or 2 of this Act, not glazed, enamelled, ornamented or decorated in any manner, 30 per cent. ad valorem; glazed, enamelled, ornamented or decorated, 35 per cent. ad valorem; brick, other than firebrick, not glazed, enamelled, painted, vitrified, ornamented or decorated in any manner, 25 per cent. ad valorem; if glazed, enamelled, painted, vitrified, ornamented or decorated in any manner, 35 per cent. ad valorem.

Scagliola Marble

An old Italian process, revived in the early part of the Sixteenth Century by Guido Sassi; is not a surface decoration, but a thoroughly artistic material. It was largely used by the Florentines in some of their most elaborate works, and was introduced into this country by Mr. J. Wyatt about 1750. It has been manufactured by this firm for the last 85 years, and fixed in many of the most important buildings in the Kingdom.

By Special Appointment

to His Majesty.

SPÉCIALITÉ for surrounding Iron or Brick Cores.

These being fixed in the ordinary course of construction the Scagliola can afterwards be fixed round WITHOUT SHOWING JOINT.

'DEVON FIRE'

Selected in the Ideal Home Competition for Hall, Study, Dining Room, Best Bedroom, Nursery.

Out of SEVEN FIRES SELECTED FIVE were 'DEVONS'

Consumption of Fuel and production of smoke each one quarter less than the average of 36 competing grates in recent official tests of Domestic Fires carried out in the new Government Offices jointly by H.M. Office of Works and the Smoke Abatement Society.

TESTIMONIAL.

DEAR SIRS,

The "Devon" Fires you supplied to the residence at Cookham Dean under my superintendence have now been thoroughly tested. They are admirable in working, giving out a great heat and being economical in fuel, as the fires keep in a considerable time without restoking. Their attractive appearance is not the least of their recommendations. I am hoping to use more of these fires in the future.

Yours faithfully,

(Signed) H. STANTON WEBBER, F.S.I., Architect, Maidenhead.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of the difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

GLASGOW.—July 31.—The patrons of the Royal Incorporation of Hutchesons' Hospital invite designs for laying out for feuing and building about 195 acres of their lands of Thornliebank, Eastwood. Premiums of 100*l.*, 75*l.*, 50*l.* and 25*l.* will be awarded. Deposit 3*l.* 3*s.* Messrs. Hill & Hoggan, 194 Ingram Street, Glasgow.

GRIMSBY.—July 30.—For the extension of the town hall, at an estimated cost of 26,000*l.* Premiums of 250*l.*, 150*l.* and 100*l.* will be awarded. An eminent architect will act as assessor in conjunction with the borough engineer. Deposit 2*l.* Apply to Mr. H. Gilbert Whyatt, A.M.I.C.E., borough engineer, Town Hall, Grimsby.

MOSSLEY.—May 24.—For the erection of a mixed elementary school to accommodate 550 children, and an infant school for 300 infants, on land adjoining Mill Lane. Premiums 15*l.* 15*s.* and 5*l.* 5*s.* Borough Surveyor, Town Hall, Mossley, Lancs.

READING.—June 15.—The Berkshire County Council invite designs for offices, committee rooms, &c., on the Forbury, Reading. Mr. Mervyn Macartney, F.R.I.B.A., assessor. Premiums of 100*l.*, 75*l.*, and 50*l.* Deposit 1*l.* 1*s.* Apply to Mr. J. Fred Hawkins, county surveyor, Bank Chambers, Cross Street, Reading.

WALLASEY.—The Urban District Council invite competitive designs from architects practising in Lancashire and Cheshire for a Public Library at Liscard, Cheshire. Deposit 2*l.* Mr. W. H. Travers, A.M.I.C.E., Public Offices, Egremont, Cheshire.

CONTRACTS OPEN.

ABERGAVENNY.—April 28.—For the reconstruction of the upper floors with fireproof staircases, new bath houses, &c., at the Monmouthshire Asylum, Abergavenny. Deposit 5*l.* 5*s.* Mr. E. A. Johnson, F.R.I.B.A., Abergavenny, on and after April 6.

Digitized by Google

Amble.—April 28.—For additions and alterations to the Central Hall, Amble. Mr. S. Pedelty, Broomhill Colliery, Acklington.

Amlwch (Anglesey).—April 24.—For erection of new schoolroom and the rebuilding of Wesleyan chapel, Amlwch, Anglesey. Mr. W. F. Brindle, architect, surveyor, &c., Mona Street, Amlwch, and High Street, Llangefni.

Bakewell.—April 27.—For various works required in erection of the Men's Institute, Bakewell. Deposit 5*s*. Mr. E. M. Longsdon, F.S.I., architect, Bakewell.

Barnsley.—April 23.—For the following work to be carried out at Royston Provided school, near Barnsley. Trades: Mason, bricklayer, joiner. New concrete roof to girls' cloakroom, breaking out windows in boys' department, &c., for the Royston district sub-committee. Mr. T. Graham, Obelisk Chambers, Barnsley.

Barnsley.—April 26.—For the various works required in erection and completion of business premises, Eldon Street, Barnsley. Messrs. Crawshaw & Wilkinson, architects, 13 Regent Street, Barnsley.

Belfast.—May 10.—For erection of additional buildings on their Purdysburn estate, for the asylum committee. Deposit 4*l*. 4*s*. Messrs. Graeme-Watt & Tulloch, architects, 77A Victoria Street, Belfast.

Braeside.—April 27.—For the mason, slater, plaster and carpenter's work of new dwelling house, East Haybogs, and of new barn, Braeside. Messrs. Hunter & Gordon, advocates, 80 Union Street, Aberdeen.

Bridgend.—April 29.—For erection of three houses at Coychurch, Bridgend. Mr. W. Y. Davies, architect, Coity Road, Bridgend.

Bristol.—May 3.—For repairs to the main roof of the Bristol Joint Station, for the Great Western and Midland Railways joint committee. The Engineer, Paddington Station.

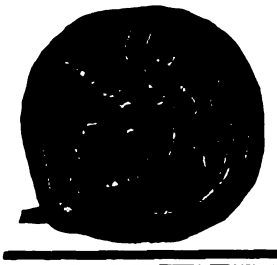
Bromley (Middlesex).—April 27.—For proposed alterations and sanitary work in connection with new bath-rooms, &c., at the District Sick Asylum, Devons Road, Bromley, E. Deposit 3*l*. 3*s*. Messrs. J. & W. Clarkson, architects, 136 High Street, Poplar, E.

Broughty Ferry, near Dundee.—May 5.—For the reconstruction and enlargement of the lifeboat house and the construction of a slipway at Broughty Ferry, near Dundee, in the county of Forfar, N.B., upon the foreshore of the River Tay and land adjoining, for the Committee of Management of the Royal National Lifeboat Institution. Mr. Jas. Hunter, junior, 63 Reform Street, Dundee, or at the office of the engineer and architect to the Royal National Lifeboat Institution, Mr. W. T. Douglas, M.Inst.C.E., 15 Victoria Street, Westminster, London, S.W.

Buckley (Flints.).—April 27.—For building a heating chamber in connection with a low pressure hot water heating apparatus. County Surveyor, County Buildings, Mold.

Camborne (Cornwall).—May 8.—For proposed addition to the Basset Road, Camborne, Council school. Mr. Sampson Hill, architect, Green Lane, Redruth.

Cardigan.—May 1.—For erection of two additional classrooms at the County school, Cardigan. Mr. James Stephens, clerk to the managers, 3 Green Street, Cardigan.



Carnkie.—April 24.—For renovation of the Primitive Methodist Church, Carnkie, near Redruth, including reseating, erection of boundary walls and other works. Mr. Sampson Hill, architect, Green Lane, Redruth.

Chartham Downs.—April 29.—For the erection of recreation-rooms and other works at the Kent County Lunatic Asylum. Deposit 5*l*. Mr. W. J. Jennings, architect, 4 St. Margaret's Street, Canterbury.

Dartmouth.—April 24.—For construction of additions to store. Mr. W. Percy Marr, A.R.I.B.A., architect and surveyor, Dartmouth.

Derby.—April 26.—For erection of extensions to the borough asylum to accommodate 126 patients, and for new workshops and bakehouse. Deposit 1*l*. 1*s*. Mr. B. S. Jacobs, F.R.I.B.A., architect and surveyor, Lincoln's Inn Buildings, Bowlalley Lane, Hull; or Messrs. Thorpe & Fryer, architects and surveyors, 23 St. James's Street, Derby.

Devizes.—April 30.—For erection of an engineer's house at the County Asylum. Deposit 1*l*. 1*s*. Mr. J. George Powell, county surveyor, County Offices, Trowbridge.

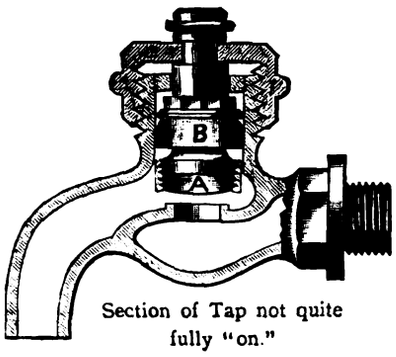
Shanks & Co., Ltd., have five model bathrooms fitted with sanitary appliances made at their works in Barrhead, N.B. There are besides Sections F, G and H, for lavatories, urinals, &c. The finish is well up to the reputation of this firm—and that is equivalent to saying it is of the best.

"Lacreite" the All-British enamel manufactured by *Messrs. Thos. Parsons & Sons*, may be seen as applied in actual practice, on the Stands of the British Uralite Company, Messrs. Candy & Co. (the Devon Fire), Messrs. Clark & Co. (Xelite Plaster), the Gypsum Mines Company (Sirapite Plaster), and the *Surveyor* office. Messrs. Parsons make a point that this enamel is made in England. The test to which it is applied on the above stands is a severe one, for the enamel was applied under building conditions, or even under more trying than that, owing to the temporary character of the work.

The English oak screen for Isfield church, near Bexhill-on-Sea, on the Stand of *Elliots' Moulding and Joinery Company, Ltd.*, of Newbury, has brought to a standstill many wondering visitors. It was carved from the designs of Mr. J. Rawlinson, A.R.I.B.A., diocesan architect, by the company, who make a speciality of executed architects' designs. On the other side is a handsomely carved double entrance door in mahogany. In the centre of the Stand is a revolving door (Buckingham's patent).

"Adamantine" clinkers in various shapes are shown by *Towers' Adamantine Clinker, Fire and Roofing Tile, Company* (A. W. Squires). It is offered as an extremely durable, clean and effective sanitary paving, suitable for markets, stables, lairs, abbatoirs and similar situations. It is made in two colours, buff and red. As a sand-faced roofing tile the buff becomes considerably darker with exposure. This clay is also manufactured into fire-bricks and fire-tiles.

The *Empire Stone Company, Ltd.*, have in the gallery an extensive display of paving slabs, combined kerb and channel dressings, a moulded spandril, and other examples of this well known stone. The company also carry out extensive ferro-concrete work such as that at the Stadium at the Franco-British Exhibition, where indented steel bars were used in the 2-inch platforms, of which there were some 17 miles, and a Leicester boot factory, where similar bars were used. On their Stand is shown the Siegwart fireproof floor, in which ferro-concrete beams are placed side by side and grouted with cement.



The *Willesden Paper and Canvas Works* (Row C, Stand 25), have for nearly forty years been turning out the Willesden paper and canvas, and between 1878 and 1888 were awarded twelve medals. The paper is made of the best material, and then receives a metal filling of copper treated with ammonia, thereby becoming practically thin sheets of metal, being waterproof and rotproof. It is much employed for underlining slates, tiles and other roofing. But it has a wider range; entire frame buildings such as bungalows, cycle and other sheds, huts, &c., may be made of it; drain pipes formed of it have been in use after thirty years; 4-ply paper replaced decayed iron guttering; the leading polo clubs in the country have their posts of it; petroleum joints; insulation chambers. Their canvas is likewise of the best material, and treated with Willesden dressing, which is guaranteed to give three years' extra life. Willesden tents have, we may say, seen service all over the globe, they can be rolled up wet and yet take no harm. Their vermin-proof quality has been often proved. At home it is used as awnings, portmanteaus, golf-caddies, flags, water buckets, van sheets, and so on.

Smoke Consumption, Ltd., fit the "Caloriser" apparatus to any boiler, furnace, &c., in one or two days, at a very small cost, and guarantee a saving in fuel. It enables low-grade fuels to be burnt under smokeless conditions without employing machinery, gas, forced draught, or special grates, or any alteration to the boilers. A letter received last month from a London factory records that after seven weeks' use they calculate a saving of 32 per cent. by the substitution of Midland slack for best smokeless Welsh steam coal. The Cowper-Coles' patents include a smokeless grate.

George Jennings, Ltd., on one series of Stalls, show three bathrooms with sumptuous suites. On a separate Stall is their patent self-contained sewage disposal apparatus, intended for country houses and isolated buildings, which should receive attention from architects. One obvious feature is its compactness and simplicity. There are many other specialities connected with sewage disposal, as well as urinals, closets, lavatories, sinks, &c.

In the Gallery, Bay 23, the *Leeds Pottery and Middleton Fireclay Works* have an exhibit which gives ample promise of the importance which will be attained by these works. The door-frame of "Ceramo" ware in semi-glaze offers architects something that is certain to become more and more in demand, especially for use in cities. There has been an awakening interest in wall materials which will withstand the grime and acid-laden atmosphere that occurs where men do congregate. English manufacturers are ready to supply that demand. "Ceramo" is here shown to lend itself to decoration. Prominent on the Stand are the bricks in hard and soft glazes, hand-made by the plastic process. The glaze is applied before the bricks are burnt, consequently the colour becomes part of the brick and will not chip or peel off, or discolour. The clay used is the finest quality "Better Bed" fireclay. The red facing bricks and bricks for engineering purposes are confidently put forward by the makers. Tests on the latter sort showed an absorption of only 2 per cent. with a crushing strain of 460 tons per square foot. Sanitary ware is represented by closets, lavatories, urinals, &c.

The new tap shown on Stand 69, Row D, is introduced by *Garratt's Patent Screw-down Valve Company*. The feature of it is the smooth piston which does not turn, but is raised or lowered by the strong coarse screw of the cap, which takes and resists the whole of the pressure. It can never fail to open even where there is no water pressure. It does away with the leather washer, it cannot be unscrewed at the wrong place, overstrained or injured. The piston only rises $\frac{1}{8}$ inch, and the total frictional travel between the packing ring B and the surface of the cylinder in which it slides is merely $\frac{1}{4}$ inch,

Section of Tap not quite fully "on."

"A" Rubber or other Seating encased in brass ring.

"B" Sliding Packing of Piston.

a vast improvement on the ordinary screw down valve. The washer A is encased in a flanged brass ring instead of the usual nut in the middle. This gives a clear way for the water directly turning on begins, and affords as much flow with the $\frac{1}{8}$ inch rise as an ordinary screw-down does with $\frac{1}{4}$ inch. It has a non-splash delivery. The tap has been approved and stamped by the Metropolitan Water Board. On the same Stand *Mr. F. H. Brook* shows the bricks of the three companies in Middlesex, Hampshire and Northants for which he acts as London agent, viz. the West End Brick Company, the Bursledon Brick Company, and the Blisworth and Stowe Brick Company.

Messrs. Cornes & Haighton may fairly claim to be housing specialists, for some thousands of model cottages have been fitted and specified with their specialities. Foremost is the "Model Cottager," combining range, copper and bath. It has been in use for some few years, and during that time the initial type has been gradually improved upon; it has now a lifting fire, a renewable oven, while the general appearance has been altered by the addition of a majolica surround. Among the successes of the "Model Cottager" was the highest award given at the Sanitary Institute Congress at Cardiff last year. Two new housing combinations are called the "Artizan," and the "Municipal." In both, the auxiliary fire is in the scullery and not in the kitchen, and the "Artizan" fits into a smaller fire opening. Messrs. Cornes & Haighton are substituting the use of porcelain enamelled baths for the metallic finished baths. One result of the efforts of Mr. Cornes and other enthusiasts for housing reform is the greatly increased number of workmen's dwellings in which baths are fitted and, we have reason to believe, used.

Digitized by Google

Messrs. Phillips & Son represent, and worthily represent, at this Exhibition, the safe-making industry. Architects and builders have as much, or more need for safes as any other class. They will find safes at Stand 22, Row B, capable of protecting the utmost wealth that they are ever likely to possess. We would recommend anyone who feels any anxiety as to the custody of valuables, to inspect one 3-ton safe, which stands 42 inches high. The door is 2 inches of solid undrillable steel, the body is of the same material of lesser thickness. The lock is an all-over lock, more familiar as the "Channel" bolt. This it will be remembered consists of a rolled steel channel section around the edge of the door, which, on the handle being turned closes into a similar channel in the frame of the safe. This same "Channel" bolt is used for strong room doors (of which one is shown), &c. A lady's jewel safe is fitted into a very ornamental inlaid wood cabinet. Party walls are also shown. One of this firm's recent contracts was for strong rooms at the Anglo-South American Bank in Old Broad Street.

The *Nautilus Fire Co., Ltd.*, are one of the firms who give a practical demonstration of the virtues claimed for their exhibits. The "Nautilus One Fire, Three Warm Rooms," at Wall Space 172, is an ingenious arrangement by which the ordinarily wasted heat of an open fireplace is utilised for warming two or three radiators placed in different rooms. The simple and cheap "Bush" fire is designed with a view to small dwellings. The Nautilus range has a new idea in the patented "Asbest" high-pressure boiler of wrought iron with a central flue. It is cased in asbestos so as to prevent the customary waste of heat by radiation, and it also insures a quick and hot circulation. The Stand offers a big choice in mantelpieces, grates and tiles.

Alexander Ritchie & Co., Ltd., ironfounders and hardware merchants, show various types of fires, kitcheners, sanitary fittings, &c., at Stand No. 153, Wall Space. Two of the grates are the "Drawwell," supplied by J. & R. Corker, Ltd., who deal only through builders' merchants, &c. The "Drawwell" was bracketed first in the 1906 tests conducted by the Office of Works and the Smoke Abatement Society. It is fitted with an adjustable canopy and solid brick back sloping inwards. The bottom forms a dish or basin with a loose grate which can be lifted out. There is a ventilating fret with pan attached. The official figures of an additional test with the "Drawwell" were as follows:—(*a*) Amount of coal, less cinders, plus half wood, 26 lb.; (*b*) ashes, 1.3 lb.; (*c*) stoking, 4.0; (*d*) temperature in passage, 43.9 degrees Fahr.; temperature in room, 52.75 degrees Fahr.; difference, 8.8 degrees Fahr.; radiation, 70.3 degrees Fahr.; smoke, 0.70. Messrs. J. & R. Corker's London showrooms are Saracen's Head Building, Snow Hill, E.C

Messrs. Walter Carson & Sons show at Stand 130, Row H. their japolite, La Belle enamel, muraline, vitrolite and a wood preservative. Japolite is an English-made japan white of three shades—white, ivory white, and blue white. It is very easy flowing, has considerable covering power, and will not crack or bloom. La Belle enamel in thirty-two shades is recommended as a high-class finishing coat. Muraline is a washable water-paint prepared in a dry powder, which is ready for immediate use by the addition of cold water in equal quantities. Vitrolite is used chiefly for horticultural work, like conservatories and greenhouses. One gallon covers about 100 square yards; two coats are advised for old work, and three coats over the priming for new. The wood preservative is a combined stain and protective agent.

Bay No. 1 in the Gallery is occupied by *Messrs. Norton & Gregory*. Specimen copies of plans made by "Velography" on several materials are shown, as well as such aids to successful work as drawing-tables, cabinets with roller drawers, surveying instruments, &c. "Velography" is recommended for the direct reproduction of plans and drawings for its speed, accuracy, permanence and prices, which range from 1*s.* 9*d.* per imperial copy. The Arcus sun-printing frame is another of their excellent aids to architects and engineers.

The *Forest of Dean Stone Firms, Ltd.*, show in the Main Hall Extension grey and blue Forest of Dean stone, Red Wilderness stone, Mountcharles stone, Bristol Pennant stone, Keinton stone, Shamrock stone, Nailsworth stone and Porthgain granite. We hope to give a more extended notice of this and other Stands in our issue of next week.

HALL'S Sanitary Washable DISTEMPER

(TRADE MARK)

The Distemper with the great covering power.

Hall's Distemper has greatest covering power and gets over the work quickly and easily. 1 cwt. will cover double the surface coated by 1 cwt. of pure white lead paint. It dries with a remarkable fine even finish, and absence of streakiness.

Distempering is easier than painting or papering. It takes less time, and the artistic Hall's Distemper Friezes, now on sale to the trade make Hall's Distemper decoration far more profitable to the decorator.

Hall's Distemper quickly sets hard, and is washable in three weeks. It is made in a wide range of 70 pleasing and permanent colours, including rich dark, as well as light shades.

It is sold in tins and iron kegs ready to mix with water.

NOTE.—Hall's Distemper should not be confused with the many so-called washable distempers now offered for sale, nor with that class of material which requires an elaborate preparation of walls. Hall's Distemper is a unique preparation with entirely distinct advantages, and is made only by

SISSONS BROTHERS & CO., Ltd., HULL.

London Office—199[B] Boro' High Street, S.E.

☛ Sample, with Pattern Book and full particulars, post free to the Trade on application.

BUILDING EXHIBITION, STAND 74, ROW D, OLYMPIA, APRIL 1909.

Wrexham.—April 27.—For alterations and additions to goods shed for the Great Western Railway Company. The Resident Engineer, Birmingham Station.

It is reported that 1909 will be a "banner" year for builders in Winnipeg, Manitoba. An American consul reports that the offices of all the architects of the city are crowded with work preparatory for one of the busiest building seasons in Winnipeg's history. It is doubtful if ever before has there been so much work in sight at this period of the year, and the majority of the buildings are of a substantial and costly type. Large office buildings, two large hotels, and numerous residences of substantial character are planned, and conservative estimates give the probable cost of building operations as from 1,600,000*l.* to 2,400,000*l.*

"The Cat in History, Legend and Art," written and illustrated by Miss Anne Marks, will be published shortly by Mr. Elliot Stock, of 62 Paternoster Row, E.C. The book will be copiously illustrated, and deals with the subject in a chatty way. It is being issued by subscription at 5*s.* per copy, but the price will be raised after publication. We note on the list of subscribers the following, amongst many others:—The Marquis of Bute (nine copies), Right Hon. A. J. Balfour, M.P., Mrs. Herbert Samuel, Lady Alexander, Sir B. L. Cohen, Bart., Sir G. Faudel-Phillips, Bart., G.C.I.E., Sir W. T. Lewis, Bart., K.C.V.O., Sir E. Letchworth (two copies), Sir Philip Magnus, M.P., Lady Nelson, Sir Isidore Spielmann, C.M.G., Sir T. Marchant Williams, Very Rev. Dr. Hermann Adler, Very Rev. Dr. M. Gaster, Rev. Dr. Oliver, D.D., C. G. Montefiore, Esq., M.A. (twelve copies), &c. Intending subscribers for this interesting book may send their subscriptions either to the publisher or to the author, at 10 Matheson Road, West Kensington.

TRADE NOTES.

ADDITIONS to Donhead House, Salisbury, are now being carried out for Sir James Pender. Chilmark stone is being used and worked at the quarries by the proprietors, Messrs. T. T. Gething & Co.

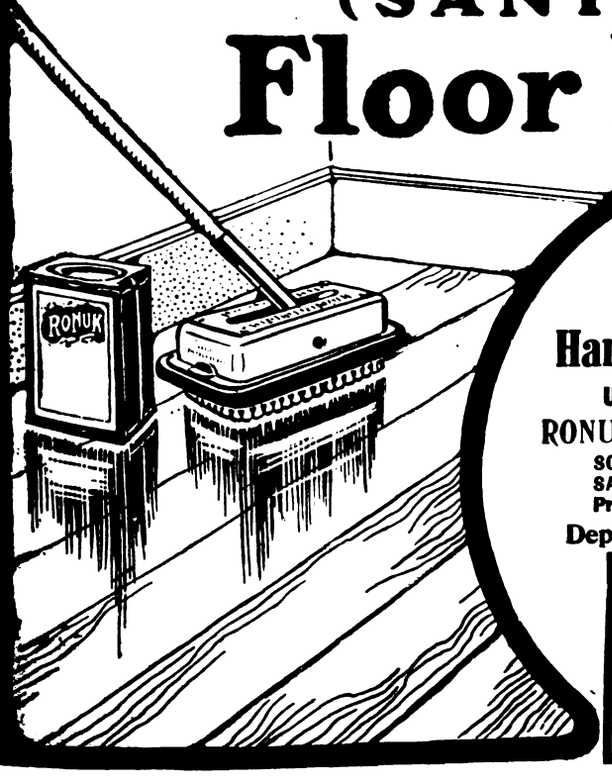
MESSRS. WARING & GILLOW, as will be seen from our advertising columns, are conducting an exhibition for the householder of every requisite for renovation and decoration of the home. A stroll through their salons will be time well spent by the visitor.

THE Dannevirke Hospital, New Zealand, is being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves with descending smoke flues, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

THE electric supply committee of the Borough of Marylebone have recommended to the Council the appointment of Mr. A. H. Seabrook, M.I.E.E., as engineer and manager of the electric lighting and supply undertaking.

THE extension to Annan Academy, erected from the plans of Mr. H. E. Clifford, F.R.I.B.A., Glasgow, has been ventilated by means of Mackay's patent direct-acting ventilators, supplied by Cousland & Mackay, Glasgow, the sole makers.

ST. CUTHBERT'S parish church, Darlington, the finest in the county of Durham, was erected by Bishop Carilef, of Durham, 1080, and remodelled by Bishop Hugh Pudsey, of Durham, 1154. The church is going to be provided with a clock and chimes by Messrs. Wm. Potts & Sons, Ltd., of Leeds and Newcastle-on-Tyne. The late Mr. Wm. Potts, principal of the firm, was a native of Darlington, and both he and his father served their apprenticeship with Messrs. Thompson, clock makers, of High Row, Darlington.



A FIRE broke out at the Belfield mill of the Birch Mills, Ltd., Rochdale, but was promptly extinguished by the "Titan" sprinklers with which the mill is fitted throughout.

THE London and Lancashire Fire Insurance Company, 45 Dale Street, Liverpool, has had a prosperous year. The total premiums now amount to 2,062,599*l.*, and the total invested funds to 2,230,580*l.* In the fire account the premiums are 1,456,291*l.*, and there is carried to profit and loss account a credit balance of 196,515*l.* In the accident account the premiums are 504,409*l.*, and there is carried to profit and loss account the sum of 30,634*l.* The net result of the year's operations is that after (*a*) increasing the accident fund from 170,000*l.* to 200,000*l.*, (*b*) paying the same dividend as for last year, viz. 84,520*l.*, being at the rate of 16*s.* per share, the balance carried forward is increased from 107,756*l.* to 252,662*l.*

THE Great Eastern Railway Company have given orders for the whole of their steamers on the Harwich-Hook of Holland and Harwich-Antwerp services to be fitted with submarine signalling.

THE total value of "stones, slabs, and marble, rough, hewn, or manufactured (other than works of art)," imported into Scottish ports during each of the last ten years was as follows:—1889, 56,538*l.*; 1900, 64,884*l.*; 1901, 113,438*l.*; 1902, 78,717*l.*; 1903, 64,582*l.*; 1904, 87,734*l.*; 1905, 77,973*l.*; 1906, 83,209*l.*; 1907, 72,252*l.*; 1908, 70,931*l.*

RONUK
(SANITARY)
Floor Polish

By Royal Warrant to H.M. the King.

Prevents the Harbouring of Germs.

USED IN THE PRINCIPAL HOSPITALS.

RONUK, Ltd., PORTSLADE, near BRIGHTON

SOLE MANUFACTURERS of this well-known SANITARY POLISH. Contractors for the First Preparation & Polishing of all kinds of Floors.

Depôts: LONDON and MANCHESTER.

Visitors to the BUILDING TRADES EXHIBITION should see our EXHIBIT, STAND No. 43, Row B, Gallery.

"THE LANCET," October 17th, 1908, says:—

"The manufacturers of RONUK have devoted special attention to the sanitary treatment of floors. Composed largely of antiseptic materials which possess the same germicidal properties as common disinfectants, but are without their disagreeable characters of smell and corrosive qualities, RONUK is an excellent floor polish, preserving a sanitary condition of the floor, sealing up all germ harbours, and presenting a surface which pleasingly evidences an appreciation of sanitary principles.

It serves as an excellent application for polished wood block, parquet, and stained floors."

BUILDING TRADES EXHIBITION.

Mr. Ernest George, in opening the Building Exhibition at Olympia on Saturday last, congratulated Mr. Greville Montgomery on the thoroughly representative character of the display, which he considered finer than anything that had been done before, and he expressed a hope that it would act as a stimulus to the prevailing slackness in trade. Sir Henry Tanner, D.S.O., also said that in his opinion the present exhibition eclipsed all its predecessors both in arrangement and in the painstaking finish of the different exhibits. Sir W. B. Richmond, R.A., expressed delighted surprise at the large proportion of the exhibits that were to be credited to English enterprise.

Last week we were able to make allusion to some few of the Stands. This week we continue these notices. There are about 350 firms exhibiting. Space and time prevent an individual account being given of each one, but we hope next week to include all that are likely to have special importance to our readers.

One of the artistic exhibits is that of the *Coatostone Decoration Company* in the gallery. The principal room is in a pale green; the walls are panelled out with moulded slats (flat enamelled with Parsons's "Endelline" enamel), and the panels filled in with "Coatostone" in a delicate green tint. The outside shows an oriel window of a stone detail made in wood and coated with "Coatostone," giving a perfect effect of natural stone. The facia and dentil cornice are in plaster coated with "Coatostone." The exterior walls are treated with a special waterproof rough-cast composition, which is applied to brickwork, plaster or cement. It is sold mixed ready for use in any tint. The hall has Greek fluted columns, with carved caps and bases of "Coatostone Stuc," which can be cast and moulded to architects' choice. The walls show an interior treated with "Coatostone Stuc"; while the overdoor is carved in the same material. On one part of the walls "Coatostone" is lined out to represent masons' joint. The example of oak panelling has the advantage of being removable and designed as a tenant's fixture. The woodwork has been treated with Parsons's "Endelline" enamel.

T. L. B. rubbers and T. L. B. facing-bricks have long been familiar to the building trades; of more recent date is the "W. K." facing-brick and the T. L. B. roofing tiles, the latter being introduced two years ago. *Messrs. Thomas Lawrence & Sons* have put up an entrance doorway of cut and rubbed brickwork, which explains—if explanation was necessary—how this firm's output from their three works has achieved its wide popularity. Another feature is the small roof exhibiting their "old" hand-made house tile with continuous nib and holed in which stained sand, forced on to the surface by a patent process, gives a well-roughened surface. They are made in dark colour or in various shades of red; both of these weather delightfully, as is shown by specimens taken from a roof at their works. The matured look is continued by the bricks, which are burnt in a special manner to harmonise with or suggest old work. The "W. K." machine-pressed facing-bricks are of a splendid colour and are sold in several qualities. They are recommended for brickwork carrying very heavy weights and where a low-priced brick is needed.

The *Cornwall Granite Company, Ltd.*, own the Gunnislake Quarries on the banks of the Tamar, and have a railway siding to Plymouth. At Bay 7 in the gallery they exhibit specimens of granite, polished, dressed, rough and broken. Their material from the Gunnislake Quarries has been used for a hundred years for docks and harbours, piers, bridges, public buildings, churches, monuments and tramways. Granite is unfortunately not a substance that lends itself to exhibition, otherwise the company would not have confined their architecturally treated granite to a single large two-light window with a quatrefoil over, though that is enough to suggest that the quarry is equipped with up-to-date machinery for obtaining the granite, and then for preparing it for use. In a Kirkaldy test a 3-inch cube withstood a crushing strain of no less than 1,049.6 tons per square foot, which is equivalent to 16,321 lb. per square inch. The Government have been much criticised in connection with the selection of Scandinavian granite for the Rosyth contract. In this connection it is worth mentioning that the Cornwall Granite Company have supplied 200,000 tons to our Admiralty alone, and can still say "the supply is practically unlimited." Municipal engineers all over the country know its value for roads.

THE "DRAWWELL" GRATE

WAS PLACED

First in the Final Tests

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjunction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public and private buildings.

BUILDING TRADES EXHIBITION, OLYMPIA,
APRIL 17 to MAY 1.

To be seen at STAND No. 153, Wall Space.

Supplied through Builders' Merchants, Ironmongers, &c., only.

J. & R. CORKER, Ltd.,
GENERAL IRONFOUNDERS, Ferham Works, ROTHERHAM.
London Showrooms, Saracen's Head Buildings, Snow Hill, City, W. B. CLARKE, AGENT, where the "Drawwell" can be seen in action.

ILLUSTRATIONS.

CONKWELL GRANGE, WILTSHIRE.—FORECOURT AND MAIN ENTRANCE—KITCHEN COURTYARD AND SIDE ENTRANCE—THE GARDEN ENTRANCE TO SOUTH FRONT—ENTRANCE DOOR AND VESTIBULE, &C.—THE HALL—THE DINING-ROOM.

Hand-power lifts for different purposes are shown by *Messrs. Hammond & Champness*, engineers, Alfreton Street, E.C. Type C is a dinner lift fitted with a self-sustaining gear by which the cage is automatically locked in any position directly the hauling rope is released. The lock is released when the rope is again pulled. No brake is required. Swivel and roller bearings prevent the shaft binding in the event of the overhead timbers becoming warped. Type E is another self-sustaining dinner lift, but it is constructed to serve under a hall table or other position when the ordinary enclosure is not desired. The floor opening through which the lift passes is automatically shut when the cage is lowered from below. In type F the lift is enclosed in an ornate cabinet and can be worked from both floors by means of a handle. This lift is fitted with a foot-brake on both floors also. The stand enables a closer acquaintance to be made with the gearing and fittings.

Chance Bros. & Co., Ltd., Glass Works, near Birmingham, prominently show "Venturene" opal tiles, and lay particular emphasis on the lustrous surface, clean cut edges and uniform sizes. Rounded internal and external angles are produced for such contracts as hospitals, where for hygienic or other purposes it is particularly desirable to escape forming a sharp angle. The cement used for setting these tiles must be of the class of Keene's or Parian; for walls where there is no likelihood of damp Messrs. Chance recommend the use of their special cement, which sets quickly and does not give off any efflorescence. The tile surface may be purchased plain or figured, and of varying tints. An extra thick opal tile is shown for use in such buildings as hospitals, subways or railway stations. Some of the vitreous tiles are prettily decorated and are suitable for rooms like nurseries or hospital wards. The firm are makers of window glass of every description, and a few samples of this department of their work are on the Stand.

"Duresco, the King of Water Paints," took the field thirty years ago. The manufacturers, the *Silicate Paint Company* (*J. B. Orr & Co., Ltd.*), have arranged Stand 50 Row C, as two rooms. The wood framing is treated with "Charlton White" flat (non-poisonous), while the panels show the charming effects of "Duresco," of which the base is a non-poisonous zinc-white pigment of a permanent character and of remarkable body and density. Its first use was for the treatment of new plaster, but now it has a much wider range though it is still warmly recommended for damp plaster where oil paint, distemper or paper would be waste of money. This characteristic is due to the admixture of silicate petrifying liquid in the proportion of 1 cwt. of paint to 1½ or 2 gallons of liquid, to reduce the "Duresco" paste to a working consistency. The liquid has been very successfully used by itself as a stone preservative. "Duresco" is stocked in three whites and about fifty tints; intermediate tints may be obtained by intermixture. Washing with cold water may be carried out after a few months when the distemper has thoroughly hardened. A sound surface can be washed down and painted with an additional "Duresco" coat of the same colour at a very small cost. Success in applying "Duresco" depends essentially on (1) using the correct proportion of thinners, too much being fatal to good work; (2) obtaining uniform suction over the whole surface; (3) selecting colours suited to the conditions to which they will be exposed; (4) not attempting to finish with two coats of "Duresco" work that would require four, at least, of paint.

Sharp, Jones & Co. are showing their rock-concrete roofing tiles. These were originally manufactured about eight years ago for export, but are now firmly establishing themselves on the home market as a cheap roof covering. Each tile interlocks with its four neighbours, and about 111 tiles equal a square of which the weight is 7 cwt. The tile is hung on the battens, set to a gauge of barely 8½ inches, with a nib. The projecting ridges on the lower part of the back of the tile interlock on the upper half of the face of the adjacent tiles. The materials employed are carefully selected to insure a very dense and hard concrete free from porosity. Any colour may be obtained.

Reconstructed Stone

can be produced in any thickness, from ¾ inch up, moulded to any section; it contains nothing that is not present in the natural stone, all varieties of which it exactly resembles in composition and appearance; it can be supplied in varying density to suit the strains of different parts of a building; and has no lamination or :: :: :: :: :: bedding planes :: :: :: :: ::

Reconstructed Marble

can be produced with an entire freedom from flaws and vents, no cramping or stopping is required. The structure, colouring, and markings are true to nature, but may be varied as desired. No flaws, vents, or stopped veins. Composition, Density, Appearance :: :: :: :: :: equal to Nature's best :: :: :: ::

We are showing at the

Building Exhibition, Stand No. 43, Row C

The British Stone & Marble Co., Ltd., 11 & 12 Finsbury Square, London, E.C.

One of the large contracts recently completed by the *Seyssel and Metallic Lava Asphalte Company* was in connection with the Mersey Dock and Harbour Board offices, in Liverpool. Here there were required 11,000 yards of Seyssel asphalte to roofs, cornices and tops of pediments and spheres, and gutters to dome and lantern 220 feet high. Metallic lava asphalte was employed as damp course to wall and site and pipe trenches, and to vertical backs of vaults. The forecourt is in Seyssel asphalte. The work was completed in 520 days by their men. The company are ready to guarantee to architects direct all contracts carried out by them, provided they are consulted as to the construction affecting their work. The analysis of the natural product, called Seyssel Asphalte, is 84.32 per cent. carbonate of lime and 14.20 bitumen. It is laid in situ in mastic form. The minimum thicknesses are, damp-courses ½ inch, floors and roofs ¾ inch to 1 inch, and paving 1 inch thick. The Metallic Lava Asphalte is not a natural product, but a manufactured article, which is especially recommended for use as a site damp course over the whole area.

Bellman, Ivey & Carter, Ltd., have been manufacturing Scagliola marble for the past eighty-five years. Their Stand includes four large slabs which were awarded a prize medal in the International Exhibition of 1851, and Sienna columns which received a medal in the '62 Exhibition. But the material was brought over from Italy more than 150 years ago. One of its most modern applications is for masking iron or brick cores. The columns are made entire and prepared ready for polishing; on their arrival they are cut vertically, placed round the centre, cramped and made good. The column on the Stand which surrounds an iron stanchion shows the impossibility of detecting any joint. Another development is the company's special process for bronzing plaster and other capitals, enrichments, &c., by hand. Scagliola is suitable for use as columns, pilasters, wall lining, architraves, pedestals; but it should be borne in mind that it is not a mere surface decoration. The cost varies according to marble selected, but may be estimated at from one-third to one-half the price of marble; the more rare the marble the greater the difference in price. The weight being much less, the cost for transit is proportionately reduced. It can be turned, moulded, or cast to any shape or design.

Benham & Sons, Ltd., are opposed to the domestic hot-water supply coming from a boiler fixed behind the kitchen range wherever the constant demands of a big establishment have to be provided for. In these cases they recommend their "Wigmore" independent hot water boiler and cylinder; for small houses and flats their own kitcheners are fixed with the customary boiler. Messrs. Benham are prepared to show that in a large house where there is frequent and great need for hot water it is cheaper to have a second fire in the independent boiler than it is to have a single fire at perpetual high pressure in the range. The "Wigmore" kitchener is fitted with folding screen-doors with inner plate to prevent the knob becoming too hot; a plate rack, which is convertible into a hot closet; and perforated cheeks to the fire to decrease the coal space when desired. A prominent object on Stands 107 and 108, Row G, is the central pattern cooking stove with underground flue, on the same principle as those provided for so many large kitchens.

The *Ruberoid Company, Ltd.*, on a full size model show its method of application on a flat-boarded roof, a flat concrete roof, and a pitched boarded roof. The growing use of concrete roofs has also witnessed a growing demand for Ruberoid as waterproof covering for it; its light weight of 2.5 lb. per yard super, its great elasticity and freedom from eventual cracks, and the durability which has enabled it to survive unhurt ten years' use on factory buildings have won the favour of architects. Another use is for insulating foundations, tunnels, bridges, &c., against ground water. The manufacturers have a large staff of skilled men ready to lay Ruberoid in any part of the kingdom, though on small roofs it is so easy to fix that a handy man can make a good job of it. This fact is one reason for its popularity among estate agents and others responsible for the upkeep of small country buildings. Once it is fixed it requires no further attention, not even a periodical painting or tarring. It should be noted that metal flashings are dispensed with, their place being taken by Ruberoid strips. It is now manufactured in three colours, grey, red and green, to give the effect of slates, tiles and green slates or old copper. During the past eighteen years all manner of buildings have been covered and otherwise protected with it. One recent success was for an order from the Italian Government for 10,000

rolls, or 20,000 squares, for the relief barracks at Messina. The firm show also at their stall preservative paints, insulating papers, building papers, &c.

There are three things on the large Stand of *Carter & Co., Ltd.*, which deserve particular attention, viz. the "Ceramic Marble" (a new ware for constructional purposes), the garden terra-cotta pottery (particularly the handsome centrepiece arranged as a fountain), and the leadless glazes. Tiles are exhibited in numerous designs and in numerous finishes for numerous purposes; but these have long ago established themselves in public favour and stand in no need of an introduction—though visitors are all the same warmly invited to renew and improve their acquaintance with these goods. Messrs. Carter have three large works—the architectural pottery at Hamworthy, the Encaustic Tile Works at Poole, and the White Works at Hamworthy. A commendable example of leadless glaze is to be found in one of the larger fireplaces. As in most of this sort of work there are charming variations in the surfaces, which remove all tendency to monotony, and which naturally occur in the kilns. The marble and ceramic mosaics are an important feature of Messrs. Carter's business, and are included at Stand 75, Row E.

Nearly twenty gold medals are in the possession of the *Emdeca Metal Decoration Company, Ltd.*, as testifying to the appreciation meted out to their decoration during twenty years. The embossed and enamelled zinc sheets are offered as a very economical substitute for tiles. Care must be taken to ensure that the walls are thoroughly dry before applying the special paste. One great feature of this decoration is the almost infinite variety in which the patterns may be combined at the whim of the user—if desired a piece of wall might have as little monotony as a patchwork quilt, for the sheets can be cut up in the manner of a scrap-book. Of course this is not commended; most people would prefer the more orderly schemes usually adopted, choosing the pattern according to the position where the sheets will be exposed. Emdeca is in great demand, and its sale is over 500,000 square yards a year. The Stand is roofed in with a "Steleonite" steel ceiling, stamped in relief. It was from this Stand that Mr. Ernest George, P.R.I.B.A., opened the exhibition.

There is a substantiality about the Stand of No. 90, Row F, belonging to the *United Kingdom Fireproofing Co. Ltd.*, that augurs well for the strength of their system. A choice of eight types of floors is offered to the architect, and four of these have been utilised in the construction of the Stand. The bottom floor, raised 4 feet from the ground, is made up in one-half of No. 1 system and in the other of No. 5 system. No. 1 system consists briefly of hollow concrete tubes about 3 feet wide supported on ferro-concrete beams, the whole being covered with concrete. No centering is required. Spans of 30 feet capable of bearing heavy loads may be obtained without the introduction of steel joists. In No. 5 system the hollow tubes are of terra-cotta instead of concrete, and are usually protected on the underside with terra-cotta soffit tiles; this floor is particularly recommended where fireproofing is the first consideration. The Stand is roofed in with a second floor combining systems No. 6 and 7. No. 6 is a solid concrete floor with square rods resting on the top flange of rolled-steel joists or on wall bearings. System No. 7 is the cheapest of the hollow floors, and utilises terra-cotta blocks 12 inches by 12 inches between the reinforced beams. Partitions of breeze, concrete, plaster, pumice and terra-cotta and a patent expansion block of terra-cotta are on the Stand. In conclusion, we would like to commend their catalogue, entitled "Reinforced Concrete and Fireproof Construction by U. K.," as being a departure from the familiar type.

The Stand of *D. G. Somerville & Co.* represents on a reduced scale the superstructure of the Paddington Telephone Exchange (Mr. Leonard Stokes, architect), which was erected by them. The roof consists of arched steel principals; the actual span of truss was 35 feet, no tie being required. The floor is the D.G.S. hollow reinforced sound and fire-resisting floor, which has a guaranteed safe load of 3 cwt. per square foot, and a total weight, including the rolled-steel joists, of 35 lb. per square foot. At Paddington there was in some parts of the Exchange a live load of 6 cwt. per square foot. The total weight of the structural steelwork was 350 tons. Specimens of reinforced-concrete piles as used at Brighton and Norwich and as stocked at the works are exhibited, together with sections of steel girders, &c., and photographs of the firm's many contracts.

RUBEROID RED ROOFING
PAT. NOV. 22. 1904.
A PERMANENT ROOFING WITH A PERMANENT COLOR
RUBEROID RED ROOFING has all the merits of the Standard Ruberoid with the added attraction of a rich, handsome colour. This colour will last for years, and is not, like paint, simply a superficial coating requiring constant renewal. The COLOUR of Ruberoid Red Roofing is an integral part of the substance of the roofing, and, as such, will not wear off.
At the BUILDING EXHIBITION, OLYMPIA, Models are on view showing the practical application of RUBEROID to flat and pitched roofs. :: Our STAND is No. 101, Row F.

The *Zeta Wood Flooring Co., Ltd.*, have covered the floor of Stand No. 85, Row E, with oak, jarrah, teak and pitch pine blocks; and the effect is excellent. A suggestive fact as to the quality of the company's work is that for two years they have been awarded the sole contract for the supply of this kind of flooring on the Zeta dowelled system to the London County Council schools, as well as being contractors to the Admiralty and the War Office. The display of parquetry is especially attractive; the designs are eminently suitable to the material and are executed in admirable taste. The whole Stand shows what high-class work can be done at reasonable prices.

Softwoods and hardwoods of all varieties are exhibited by *Ingram, Perkins & Co.*, as well as compo-board, three-ply veneers, mouldings, and as representative a general collection as can be made in so limited a space from the stock of an important firm of importers and merchants. It is, of course, difficult to bring together for a fortnight the eighty-one varieties of planed quarterings, fifty-five varieties of planed boards, 119 varieties of flooring and matching, and specimens of woods from every quarter of the globe that are ready for purchase by customers.

The "Eureka" sash balance (Neren's patent) is shown by *Messrs. Allen & Norris*, who have the sole rights for Great Britain. The patent dispenses with weights, pulleys and cords, without altering the external appearance of the window. The customary rattle and jarring of the weights is therefore obviated, even if old frames are fitted with the balance. Should by chance any readjustment be necessary, it is easily effected, for the parts are few and simple.

The *Medway's Safety Lift Company* are able to accommodate their electric passenger-lift gear on a small corner of the stand. It is self-contained, very compact, and can be fixed either on top, underneath, or at the side of the lift. The Scott-Medway safety automatic control removes all danger to life or limb in the event of a breakdown. The push-button electric lift is here represented on a small scale suitable for dinner lifts. There is also on the Stand a Medway's silent self-sustaining dinner lift, worked by a hand rope, of which the principal points are its silent and easy working and its sustaining power.

There must be a large number of the visitors to Olympia who have often specified or used Monk's Park Bath stone, but who have never known how it is obtained. For all such an instructive exhibit has been arranged by the *Bath Stone Firms, Ltd.*, in the shape of a representation of one of the tunnels, 80 feet below ground, in their mine, with the plant necessary for sawing and removing the blocks. There is an admirable collection of masonry in the various stones quarried by the company. It includes pierced terrace walling in St. Aldhelm Box Ground; corn-grit column base and cap; two-light Gothic window in Monk's Park stone, with sill string and label in Box Ground; sundial pedestal in Box Ground; Farleigh stone range-work. Among the Portland specimens are the following:—Balustrading, cornice with medallions, twin column with base, cap and four-way springer. Extremely interesting is a sample stone marked by Sir Christopher Wren when selecting stone from the Wakeham district (now worked by the Bath Stone Firms, Ltd.) for St. Paul's Cathedral.

The brilliance of the display by the *Brilliant Sign Company* (1907), *Ltd.*, fully justifies their right to the trading title. Competition between the businesses carried on in shops has rendered the exterior sign of enormous importance, and one on which the gross receipts are sure to depend to a lesser or greater extent. The above company are in a position to meet any possible demands, for at the Paragon Works, Shepherd's Bush, W. (which cover nearly two acres) they employ more than 500 workmen. The brilliant letters are stamped in stout sheet copper from steel dies, and then gilt under a secret process. Gilt wood letters are also made.

The Windmill Roofing Tiles are manufactured by *Watson, Nelson, Ltd.*, in dark and medium red shades, at Napton, near Rugby, and are fixed by nails or nibs. Notable characteristics are their rich colour, the clear ringing sound when two are struck together, and their strength. The tiles may be purchased hand or machine made, smooth or sand faced. Messrs. Watson, Nelson, Ltd., have a patent fluting in which the channels are carried about 2 inches above the bottom edge of the upper tile to enable them to withstand the severest weather. In addition to tiles the manufacturers produce finials, ridges, and all tile fittings, bricks, adamantine flooring, &c.

No. 330.

This Closet is brought into action by gentle pressure on the button, when the Cistern is immediately discharged with great velocity.
It is suitable for any position, but particularly where there is insufficient headroom for the ordinary type of water waste preventer with flush pipe.

The "Edwardian" chimney-pots and the "Mon'lithcrete" fire-resisting floors of *Messrs. Mark Fawcett & Co.* have in the past few months received detailed notice in our columns. An indubitable testimony of the efficacy of the pots is afforded in a letter received within the past week from Messrs. Joseph & Smithem, architects, stating that after using 1,000 of the "Edwardian" chimney-pots and having found them satisfactory, they are going to use an additional 1,000. The "Mon'lithcrete floor" consists of lattice girders (from which the compression members have been removed) in combination with concrete. In a recent test a span of 16 feet was loaded up to 17 tons, and the deflection was 1 inch; the load was then increased up to 14 cwt. per foot super, when the deflection became 2¼ inches. On the load being removed, the total deflection was 1⅜ inch. These results could not fail to give the greatest satisfaction and confidence in Mr. Mark Fawcett's invention.

Messrs. Bristowe & Co. show a number of sanitary specialties known as H.H. series, which mark a departure in the direction of common-sense principles as applied to the design and construction of sanitary apparatus. The H.H. gulley is automatic and efficient in its action, being cleaned by each flush. The H.H. lavatory is designed and constructed to prevent any accumulation of filth on or about the basin or overflow. The soap trays are made sufficiently sloping so that the soap is always dry. The H.H. closet possesses two perfect mechanical joints at the outgo and flush-pipe connections made with metal clips, dispensing entirely with the accustomed uses of putty and paint. The capacity and large water area of basin are points also of advantage. The H.H. seat is anatomically formed, and prevents much of the discomfort of the old type. The H.H. grease trap is in metal for use under scullery sinks for arresting grease, instead of allowing it to contaminate waste pipes. The H.H. bath is a combination of children's bath, foot bath and a bath for adults, which effects its purpose with the minimum quantity of water and, being upright, occupies the smallest possible space. It is eminently suitable for artisans' dwellings, cottages, public institutions, barracks, &c. The main feature is an overhead tank with showers, into which the hot and cold water supply are taken either together or separately.

One of the biggest displays is that made by the *Standard Sanitary Range and Foundry Co., Ltd.*, at Stands 137 and 138, Row H, with an overflow on wall space 176 opposite. A prominent feature is the large selection of chimney-pieces, which must surely contain something to suit everybody's taste. The majority are equipped with a "Burkone" interior. The "Burkone," it will be remembered, is a fire standing above the floor level and with a sloping bottom in the centre of which is a perforated iron cone on which the coals drop as they burn away by their own weight, thus insuring a bright fire to the last without any poking. The fire can be adapted to any other kind of surround and to any design. Among those who have made stock designs are Mr. C. V. Voysey and Mr. Arnold Mitchell. Another department is the Standard combination gas and coal range as supplied to the Office of Works. In it the large oven is adapted for heating with coal or gas, and when the gas hot-plate is not in use it can be swung back, leaving the hob clear. It is fitted with the latest higher-pressure boiler heated by gas, which costs a penny an hour. The gas coil can be employed in conjunction with or independently of the ordinary bath boiler. Yet another department is brass-foundry, ironmongery and rainwater castings; in both there is ample recognition of the welcome public demand for good designs. The Stands include sanitary ware, like baths, flushing cistern, pedestals, lavatories, &c.

The latest addition to the many patent and unpatented tiles manufactured by *Colthurst, Symons & Co., Ltd.*, at Bridgwater, is the "Paragon," which has for its main object the absolute exclusion of all rain-drift. The "Acme" tile has been on sale for over two years, is made by "machine process" and has a patent interlocking surface. Their ridge tiles, finials, &c., are also represented.

The genuine Portmadoc slate may be seen and admired at the Stand in the Annexe of the *Maenofferen Slate Quarry Co., Ltd.*, who have extensive quarries at Blaenau Festiniog, North Wales. The slates are of blue-grey colour, very uniform and free from defects. An unusual "sample" is the cut-slate fan, which folds up in the same manner as one of silk. During the day interesting demonstrations are given of splitting slates from the rock and dressing them ready for roofing.

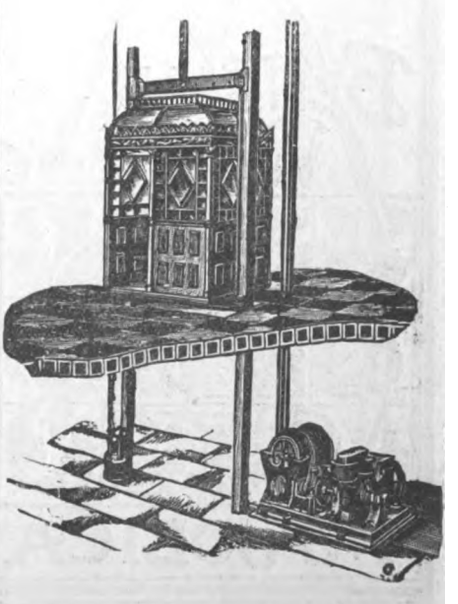
"Bond" Stove



Recent Testimonial.

Chelmsford, 12th January, 1909.

DEAR SIRS,—I have very great pleasure in stating the "Bond" Stoves have given me entire satisfaction, and I have no hesitation in saying, that if I were purchasing stoves for a new house I should, with my present experience, have all the fireplaces fitted with them. Apart from the great heat generated, and thoroughly distributed about the room, they are most economical in coal consumption.—Yours very truly,
(Signed) WILLIAM F. GEPP.

If the present Building Trades Exhibition has any right to be called "The House Beautiful," it must be mainly through the presence of such firms as *Ripolin, Ltd.*, who play so important a part in house decoration. Stand 102, Row F, is effectively arranged as four interiors to demonstrate the effects procurable with this enamel in gloss and flat finishes, or with the two in combination. The third side, showing a bathroom (with bath fittings supplied by the Standard Sanitary Manufacturing Company), is particularly pleasing. But the whole Stand will give delight to visitors.

Doulton & Co., Ltd., are inseparably connected with sanitary appliances, and of these a selection is shown on their large Stands in the Main Hall Extension. To avoid bewilderment the comprehensive exhibit is divided into sections or rooms. The principal room is a luxurious bathroom completely fitted up with marble-faced walls and floor. There are three other bathrooms on varying lines; one is typical of what might be carried out in a house of moderate rent. It includes a porcelain enamelled cast-iron bath on wheels, so arranged that the tub can be pivoted on to the waste end, thus making it possible to clean the walls and floor—a highly desirable advance on the old fixed bath. Then follow rooms with different lavatory appliances, and one with fittings required for the hydro-therapeutic treatment. The general exhibit is a collective display of the company's manufactures. Then there are tile linings, pipes and fireplaces. Architects will be especially attracted by the Carrara exhibit, a ceramic ware that has enjoyed a comparatively short but highly successful career on large city buildings.

The *Japanol Enamel Company* offer their bath enamel in the confident knowledge that if their directions are carried out entire satisfaction will result after three thin coats have been applied. "Japanol" is a slow-drying enamel, and it is advised that from two to three days should elapse between each coat. It is almost superfluous to mention that the enamel is also made for use on wood, metal, or stone in glossy or flat quality for inside or outside work. A strip of tin coated with "Japanol" may be twisted and bent without producing any sign of a crack. Its wearing powers have gained it a place on the woodwork of ocean liners. The surface presented is admirable to look at and feel.

Messrs. J. A. King & Co. exhibit their well-known "Mack" fire, sound, and vermin proof plaster partitions, showing the slabs keyed for plastering, as well as the smooth faced blocks which require no plastering. The "Mack" slabs, 2¾ inches thick, have been tested to 2,250 degrees Fahr. by the British Fire Prevention Committee. They are also exhibiting the "King" fireproof pumice concrete partitions, and the "Mack" fire-resisting ceiling slabs, which are nailed to wooden joists with large-headed galvanised nails, and then plastered over. The "Mack" fireproof pugging blocks and slabs for wooden floors are made in from 1 inch to 6 inches in thickness, and in any width. They are usually laid on fillets spiked to the joists. The "Mack" fireproof floor-steel construction shown is of "Mack" slabs laid on the lower flanges of the joists, the space above being filled in with concrete or other materials. The space is often left open, and the slabs are laid on the top of the joists. A speciality this year is the "Mack" fire-resisting roof construction, the "Mack" fireproof lathing for encasing columns, girders and stanchions, forming coves, &c. It is made with their plaster in strips applied to canvas; it can be bent to any curve. The steel corner plate for protecting plastered corners is a galvanised steel rail, fixed with metal clips to brickwork. It saves a great amount of labour in plastering, but no plaster screeds are required when the corner plate is used.

The *Clee Hill Granite Co., Ltd.*, show a small selection of setts, macadam and chippings. The setts have been taken up after twenty-five years' use and relaid on the reverse side. The macadam was favourably commented on in the inquiry by the Royal Commission on Motor-cars, and the screenings are much used for footpaths, drives and concrete work. Two months ago the company opened an aerial ropeway three and a half miles long to connect an important extension on the eastern side of Clee Hill with the local light railway. The present output is 125,000 tons a year, and the plant at the Catherton extension is capable of turning out an additional 200,000 tons. The ropeway is one of the longest in the kingdom, and is remarkable for the fact that it was impossible to run it in a straight line between the terminals, necessitating an angle station. The company are now in a position to cope with unlimited orders.

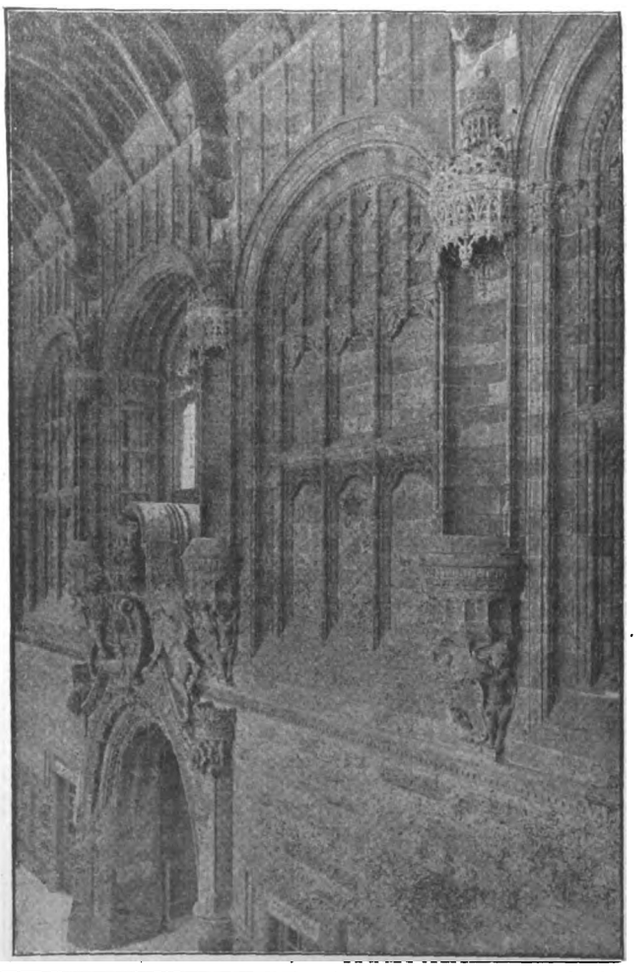
"Water Temple and Fountain in the Style of the Eighteenth-century Renaissance" is the official description of the Stand of the *British Stone and Marble Company*, Row C, No. 43. It is entirely of reconstructed stone. By this process quarry *débris* is calcined in closed retorts, the carbonic acid gas generated being collected and liquefied. The lime so obtained is mixed with a proportion of the stone to be reconstructed after it has been reduced to its original grains. The material is then thoroughly mixed in a rotary drum and hydrated. The mass is pressed, and a density can be given to it equal to, or higher than, that of the best quality stone. The product is fashioned whilst in a soft state; after being worked it is placed in a cylinder, a vacuum created, and the carbonic acid gas previously extracted is fed thereto. This permeates the entire block, making the whole crystalline throughout. Building stone of every description can be obtained in this manner at a substantial reduction on the cost of the quarry-wrought product. More than one kind has been introduced on the sculpturesque Stand. Very favourable expert reports have been made concerning the chemical nature and resisting powers of the stone. The British Stone and Marble Company, the sole owners of the process, wish to emphasise that their reconstructed stone is different to an artificial product, for it contains no other cementing medium than that found in the quarried material, and that nothing is added that is not present in the natural stone.

On one corner of *W. Oliver & Sons', Ltd.*, Stand, No. 47, Row L, is a very handsome solid Cuba mahogany door, cut in the solid. It has six panels with an open fanlight. The figuring on the wood is handsome, and the polisher has worked the wood up to a rich dark colour. The combination of man's and nature's work is most admirable.

The half-timbered pavilion of *Messrs. Machin & Koenig* shows the different uses of Speaker's "Eternit" asbestos slabs, which are applicable for roofing slates and for ceilings, inside walls and partitions, as well as for fire doors, railway-carriage and motor-box linings. There are also illustrated the employment of compo-board and laminated panels.

The *Well Fire and Foundry Company* have a striking series of fireplaces which at once arrest the attention by their artistic appearance even of those who are not able to appreciate at a glance the scientific principles involved in their patented Well and Pyramid fires. It is enormously true of fireplaces that those who buy in haste will repent at leisure. It is comparatively simple to cover up mistakes made in the selection of wall papers, paint, carpets and other household accessories; but once a fireplace is installed it is likely to be a permanency. Therefore it is advisable to get a general idea of what the best firms offer before deciding. Such an inquirer cannot fail to derive pleasure from the products of this firm. Their designs are conspicuous for their studied simplicity, whether the fireplaces are in steel or tiles, marble or faïence, and show genuine craftsmanship. The same remark applies to the mantlepieces. Stand 100, Row F, has some of its finest articles in the inner aisle or inside.

"Corketa" is a new departure of the *British Cork Asphalte, Ltd.* In the past their exhibit has been more conspicuous for utility than decoration; this year the material assumes a really ornamental appearance. "Corketa" are tiles made in various colours, having the effect of marble or terra-cotta while retaining all the same advantages of cork asphalte. "Corkite No. 1" is intended for pedestrian indoor work where silence is the first consideration; "Corkite No. 2" is a cheaper material. Another novelty is asphaltine, a cheap and enduring paint for metals. Cork asphalte, the parent of all these, still maintains its position as paving for the most trying situations.



The "H. B." system of reinforced brickwork is shown by *Messrs. Richard Johnson, Clapham & Morris*. The reinforcement, consisting of a galvanised steel wire-netting band from 2 inches to 2½ inches wide, is inserted in the mortar joints. In a recent test an "H. B." reinforced 5-foot cantilever wall, 3 feet in height with a 4½-inch out wall, a 1½-inch cavity and a 3-inch inner wall, did not break until a load of 10,640 lb. had been imposed. The 7½-inch partition wall consists of two "H. B." brick-on-edge walls, with a 1½-inch cavity. Johnson's reinforced concrete system, on direct lines of tension, establishes a continuous bond in the concrete, so as to make a monolithic construction.

"Sirapite" is a cement plaster manufactured from gypsum by the *Gypsum Mines, Ltd.*, at Mountfield, Robertsbridge, Sussex, and Kingston-on-Soar, near Derby, and of which about 254,000 tons have been sold. Their Stand in the Annexe consists of a pavilion architecturally designed in grey sirapite and sand on patent block partitions. The interior walls show the plaster finished in a variety of ways, such as polished and treated with different paints and enamels. One of their large contracts was for the London Hospital; another was for the King Edward VII. Sanatorium at Midhurst. The pieces of sculpture are in the company's Italian fine plaster. The office walls are finished in white Keene's cement.

The *Ajax Sanitary Co., Ltd.*, show a range of lavatories, sinks and baths fitted with an ingenious and simple form of shutter waste and overflow. This enables these fittings to be kept in a state of high and even surgical cleanliness. There is no concealed part whatever about those parts of the fittings so liable to accumulate filth and dangerous matter. The shutter is readily removed, and the whole overflow and waste are rendered easily accessible. The lavatory possesses a feature of having the taps at the corners of the basin, thereby giving ample head room and convenience. In the lavatories and sinks the shutter is kept in position merely by the pressure of water in the basin, and when removed the fitting empties itself silently and rapidly, leaving a perfectly clean basin. In all cases the traps of the fittings are all one piece with the fitting, so there is no joint on the top side of the trap to get filthy. As a fitting for cleanliness nothing more could be required. On the Stand is their patent "Concentric" door latch, designed to withstand specially hard wear. It is reversible, works smoothly, and the handle has no back lash no matter how hard the door is slammed.

The *Van Kannel Revolving Door Company, Ltd.*, are exhibiting at Stand 53, Row C, an entirely new form of revolving door, which has been designed to ensure the safety of the public in the event of a panic arising in large buildings. At the same time it retains all the advantages of the ordinary revolving door in preventing draughts, dust, smells, &c., entering through the doorway and thereby rendering halls, vestibules, &c., uninhabitable in cold weather. No knowledge of mechanism is necessary to collapse the new panic revolving door; the pressure of a rush of persons will do it, no matter in what position the wings of the revolving door may be. The wings all fold neatly together like a fan, and the sections of the circular casing can also be made to collapse outwards. From the collapsed position the door can be put back into its original position in a few seconds. One of these panic revolving doors has been inspected by the fire brigade and the London County Council, and many orders have already been received, including two for the new Victoria and Albert Museum.

"Minerva" Paint is prominent in the temple to Minerva erected by *Pinchin, Johnson & Co., Ltd.* Several panels show the paint from priming to finish. The actual Stand is enamelled in "Satinette," with dazzling effect. Some of the doors have been painted with "Minerva" and finished with Venus copal varnish.

C. A. Peters, Ltd., supply the well-known wood preservative "Carbolineum," which has been used for a quarter of a century. A good many years ago the manager of the signal department of the Midland Railway buried two blocks of deal. After three years they were dug up, and it was found that the piece untreated was half decayed away, while the piece done with "Carbolineum" was perfectly preserved. "Okin-Vash" is a new paint-cleaner, which instantaneously removes all dirt, without the least injury to the surface. Also shown are the portable all-metal stoves, which require no chimney or flue, and consume the patent "Carbotron." The fire will burn twelve hours without attention. The fuel is all enclosed, and cannot possibly cause a fire. The stoves are recommended by insurance companies.

Exhibits like that of *Messrs. Campbell & Christmas*, St. Oswald's Studios, West Brompton, make a welcome change to the very utilitarian character of most of the Stands at Olympia. It certainly should revive any visitors who get rather overwhelmed by technicalities concerning bricks, sanitary ware, fires, floor construction, and so on. There is always a pleasure in seeing well-designed stained and leaded glass. One interesting use is for the glass dome in the ceiling. Iron casements and mosaic work give additional interest, not to mention the cartoons and sketches required for studio use.

On Stand 83, Row E, *Messrs. Hofler, Ltd.*, are exhibiting (in the same position occupied by them as at the last Exhibition) a fine Georgian mantelpiece carved in Austrian oak, with swags and drops round the centre frame, forming a very effective contrast to the oak. The centre panel is filled up by a replica of the portrait of Lord Chesterfield. To display the art metal work from their Chiswick forge they have erected a small staircase and platform, having on one side a length of balustrading of French design in polished steel and bronze of the Louis XVI. period, whilst on the other is a wrought-iron balustrading in the Georgian style. For this class of work the firm have earned a well-merited distinction. The whole of the metalwork has been executed at their works, the Chiswick Forges, Young's Corner, Hammersmith, where clients are cordially invited to inspect their orders during progress. Their exhibit also comprises a collection of Austrian oak panelling and chimneypieces, of superior execution and finish, at prices which compare very favourably with any on the market for the same class of work. On Stand 84, in the same row, the firm exhibit their Sheet Lead Damp Course, which has been very extensively used by His Majesty's Government, one large contract being for the new Admiralty dockyards at Malta.

The Lock Woven Mesh System of reinforcement shown by *James H. Tozer & Son, Ltd.*, is conspicuous by the fact that the wire mesh is locked or knotted at the intersection of the tension and transverse wires, making them immovable and establishing a mechanical bond. The material is manufactured of drawn steel wire with elaborate care. Messrs. Tozer & Son lay stress on the fact that they do not claim to construct heavy beams, cantilevers or columns with the mesh; but they do claim that it effects great economy if used for roofs, floors, walls, sewers and the like. In practice it has been found that the labour cost in handling and laying the lock woven mesh varies between one-eighth and one-half penny per square yard. The Stand has four Doric columns, with pedestals and entablature; a short length of egg-shape sewer, 60 inches by 40 inches; and a length of retaining wall, 5 feet 6 inches high—all of which are reinforced with lock woven mesh. The structure, raised some 5 feet above ground, may almost be called homogeneous, for the mesh of the floor and roof are joined by a lighter mesh, plastered over to form the walls. Messrs. Tozer have prepared their calculations on lines identical with the recommendations of the Institute, although they consider the factor of safety in their material is higher than that provided for in the R.I.B.A.

The *Patent Indented Steel Bar Company, Ltd.*, have been prospering since the previous Building Exhibition, and now possess offices at Manchester, Birmingham, Leeds and Glasgow, and have erected many important structures with the Indented Bar reinforcement, some of them according to designs made by the company. A unique work was the Cleethorpes circular water-tower, 174 feet high and holding 250,000 gallons; the bars were used for the vertical and horizontal reinforcement throughout. A recent work was the Selfridge Stores, which was completed in record time despite serious initial difficulties.

The *Armoured Tubular Flooring Company* exhibit at Stand No. 41, Row C, a strip of reinforced concrete fireproof flooring constructed in their armoured tubular system. The floor is erected without the aid of centring, and constructed of concrete webs reinforced with a steel bar and of concrete tubes fitted between webs. The whole is finished with a thin layer of concrete. An opening has been left to demonstrate how this flooring can be trimmed for stairs, lifts, skylights, &c. The upper side of the floor shows some finishes that may be applied; a small area left altogether uncovered exposes the webs and tubes.

Any exhibit of the *England Works, Leeds*, may be safely counted upon to present some entire novelty, or at the least, an improvement on a previous patent. For 1909 they have two new ideas (1) the "England" steel skylight and casement frames; and (2) the "England" emergency bolt for double-action doors. Their balanced self-opening skylight is operated by a thin blind-cord, the weight of the frame being counterpoised by an adjustable balance weight. It automatically locks in any position when the cord is released. The contrivance must commend itself to all who know the trouble of working the ordinary skylight. Another fitting of interest is a folding wire partition, suitable for any cloakroom or lavatory that has sometimes to be partly screened off. They hang on transom, or run on a bottom track. The panic bolt is a knob which releases the lock if struck smartly.

THE

Festiniog District Slate Quarry Proprietors' Association

THE Members constituting this Association, whose names are subjoined, beg to notify Architects and the trade that they are the producers of the genuine **Portmadoc Slates,** and would respectfully invite co-operation in discouraging the sale of other, and inferior, slates as such.

¶ The Members will be pleased to supply Acid, Water and Breakage Tests, with full Analysis; also a list of important Government and public buildings upon which their slates have been used during the past 100 years.

¶ Portmadoc Slates contain, according to analysis, only **1** per cent. of lime, whereas the imitation composite slates, now extensively advertised, show much variation; samples recently analysed contain upwards of **40** per cent. of this highly perishable substance, and are liable to an absorption of moisture **forty** times as great as that of Portmadoc Slates.

PROPERTY IS ENHANCED IN VALUE

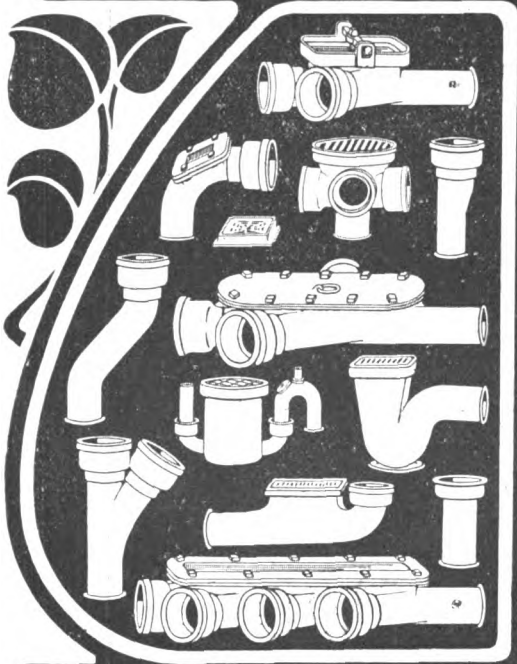
by every modern convenience that is introduced.

PROVISION SHOULD BE MADE IN EVERY HOUSE AND FLAT

for the use of **Gas,** not only for **Lighting,** but also for **Cooking, Hot-water Circulation,** and **Fires,** in every room.

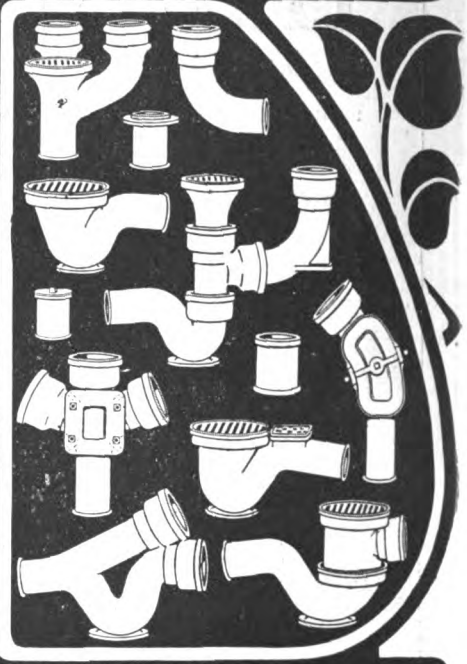
The rapid displacement of solid fuel by **Gas** is one of the features of modern city life.

The Gas Light and Coke Company



will be pleased to co-operate with any **Architect or Builder** erecting Property in their district, with a view to the most suitable arrangements being made for the use of Gas, if he will communicate with their Chief Inspector (Mr. F. W. Goodenough) at

HORSEFERRY ROAD, S.W.



Telephone: 801 Gerrard.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

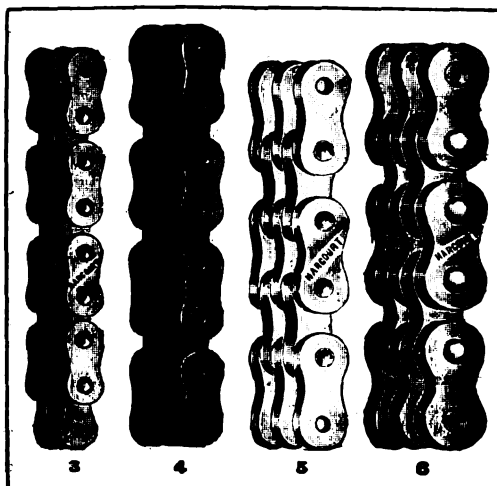
Withernsea.—For erection of a large skating rink and recreation hall, together with other buildings, at Withernsea, near Hull. Send names to Messrs. Freeman, Son & Gaskell, architects and surveyors, Albert Chambers, 11 Carr Lane, Hull.



Wrexham.—May 5.—For the completion of the erection of the Alexandra schools for the education committee. Messrs. Burrell & Willey, architects, Market Place Chambers, Durham.

York.—May 1.—For certain works to be executed at the large hall of the Exhibition Buildings, York, for the Corporation. Mr. F. W. Spurr, city engineer, Guildhall, York.

The Leeds City Council have appointed a committee to wait upon members of Parliament in London with a view of the amendment of Clause 44 of the Housing and Town-Planning Bill relating to back-to-back houses. The town clerk has prepared a statement, in which it is pointed out that the type of back-to-back houses now erected is very different from the old type found to be objectionable. The working-classes are stated to have an aversion from tenement houses, which are the only alternative to back-to-back houses. From 1900 to 1908 as many as 17,539 dwelling-houses were erected in the city, and of these 9,826 were back-to-back houses. The Leeds Corporation consider that the prohibition of the erection of back-to-back houses would render the position of the working-classes worse than it is to-day so far as housing is concerned.

FINCH'S

"SILENT FACILE"

Closet.

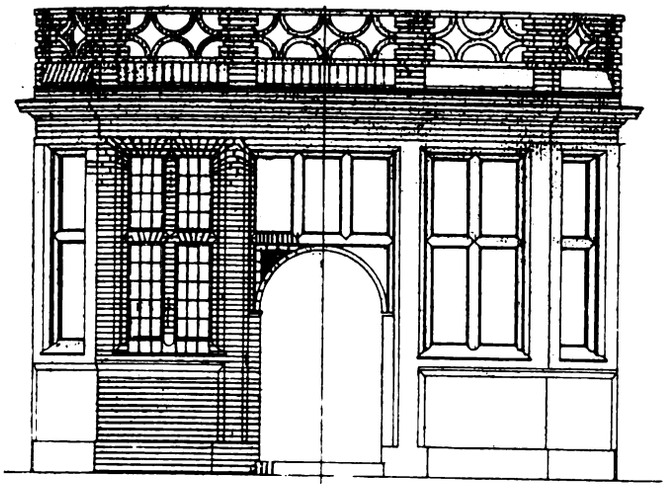
HYDRAULIC, NOT PNEUMATIC.

Can be seen with other specialities at the Building Trades Exhibition, Stand No. 237, Row P.

FOR PRICES AND PARTICULARS APPLY:—

B. FINCH & CO., LTD.

MANUFACTURING SANITARY ENGINEERS,



82 BELVEDERE ROAD, LAMBETH.

No. 330.

This Closet is brought into action by gentle pressure on the button, when the Cistern is immediately discharged with great velocity.
It is suitable for any position, but particularly where there is insufficient headroom for the ordinary type of water waste preventer with flush pipe.

Digitized by Google

This pavilion was designed by Mr. E. L. Lutyens to display the bricks of the *Daneshill Brick and Tile Works*, Basingstoke, and was erected by Messrs. Higgs & Hill, Ltd.,

South Lambeth Road, S.E. The bricks are red, hand-made, sand-faced and moulded to the architect's design. The company make facing bricks, roofing tiles, hand-made quarries and garden bricks.

The *Gilmour Door Company, Ltd.*, show their built-up door, in which the hardwood veneers are of many varieties, each being guaranteed against winding, warping, shrinking, shaking or blistering. The novelty on the Stand is the Anti-Cyclone Door which has been made for the Strand Hotel, W.C. It has several departures from the usual revolving door, while it answers the same purposes. One remarkable feature about it is that the two doors divide in the middle on a very slight pressure, and the doors swing back into the sides, leaving a free passage. This makes it an admirable emergency exit. It is, moreover, a two-way door. When it is at rest the wings swing back into the circular sides, leaving only the two central doors.

R. Waygood & Co., Ltd., have again had the enterprise to instal a working passenger-lift, in an ornamental wrought-iron enclosure, for the conveyance of visitors to the Exhibition free of charge up to the gallery. On the Stand is a working model electric push-button lift, in which the car is fitted with as many buttons as there are floors. Upon entering the car the landing door should be shut, and the button pressed corresponding to the floor it is desired to stop at. Until the landing door is shut the lift is immovable. The car automatically stops at the proper floor. On each landing is a button, which, if pressed, will bring the lift, if not in use, to the door. This contrivance does away with the need for an attendant. Another working model is of a a suspended hydraulic lift suitable for large towns where high-pressure water mains are available. Messrs. Waygood have made a special study of safety appliances for the prevention of accidents, and have at least four appliances for locking the rope so as to avoid the risk of the lift being started while it is being loaded or unloaded at any floor. Their "Electric" Grip in addition prevents the lift being started unless all the doors are closed, or any door being opened except when the lift is opposite. There is a model of their patent wharf crane. Hand service lifts are also shown.

The *Carron Company* would require an exhibition to themselves if they attempted to display all the things they sell for use in houses. What they have selected for Olympia is a fine array of armour bright grates and interiors, two porcelain-enamelled baths, some wood mantelpieces and marble surrounds, and a few other fittings. The grates are from designs prepared in the eighteenth century for the Carron Company by William and Henry Haworth, who were, a placard tells us, students at the Royal Academy during the presidency of Sir Joshua Reynolds. It would be interesting to hear the comment of these designers when they saw the fire opening framed in marble. The grates are fine examples of ironfounding.

At Stand No. 177, Wall Space, will be found an exhibit of the Silbermann heating apparatus (agents, *Messrs. John C. Bonnin & Co.*). The fireplace consists of a closed metallic casing, which is so made as to give the utmost radiating surface and at the same time insure that the hot air is completely sterilised.

Recent Testimonial.
Palmers Green, N.
Gentlemen,—My wife pronounces the "Sine Qua Non" to be the best Range she ever had. It is clean, both bakes and roasts well, and consumes little fuel.
I have had many years' experience with Ranges, this being the fourth house I have built for my own occupation.
The "Bond" Fires are also highly satisfactory.—Yours truly, (Signed) George Jackson.

The *Coalbrookdale Company, Ltd.*, at Wall Space 181 and 182, have an exhibit that is notable for three things—viz. the "Tilt" Fire, the "Thrift" Portable Range, and, what is perhaps more artistically interesting than either, the Damascene Work. The "Tilt" Fire, illustrated herewith, provides a remedy for an evil that has been a chronic one. We refer to the difficulty of getting the fire alight

and of getting warmth at once. The "Tilt" fire has come to remove that annoyance. The coal rests in a basket, with detachable firebrick sides and back. Before applying a match this basket is tilted up at an angle of 45 degrees and the canopy is pushed in, the result being that the upper fixed part, as shown in the illustration, acts like a newspaper while the air passes through the open bars of the bottom of the basket. In ten minutes the fire is bright, the cold air is driven out, the basket is lowered, the canopy drawn out, and the grate becomes a slow-burning one, which may be left for hours without any attention, and whose rate of combustion is regulated by the fret. A low fire is replenished and rendered bright again by tilting the basket for five minutes. By painful experience we have learnt that most fires show their resentment of lack of attention by refusing to come back to life. This petty spite is now escaped. All the parts are renewable. Although the fire is a comparative novelty, over 1,000 have already been sold. The "Thrift" Portable Range is a small one, on which the boiler and oven or ovens are heated by the same flue and at the same time with a small amount of the cheapest coal. In our opening sentence we alluded to the "Damascene" work as a pleasing and unique feature. This is something quite new in modern work, although our museums contain beautiful examples of it as applied to the inlay of armour, vases, swords, &c., with gold, silver and other metals. Within the last century grates were ornamented by the inlaying of metals in iron, but the process was elaborate and exceedingly expensive. Even then the work was confined solely to the inlaying of brass in an iron background. The Coalbrookdale Company, however, by a method (for which a patent has been applied) have succeeded in producing highly artistic results in the inlaying of iron and copper in a brass background, or vice versa, at a small cost. The brass is cast first and laid in a mould, then the iron is cast around it. The effect is equal to that of the old work, but is very much less expensive. The inlaid metals can be chased or engraved, thus enhancing the general effect. This might be called "Sheraton," for the inlay can be applied in a similar manner and with no less charming results. This "Damascene" work is therefore something new, with which the architect can render the house still more beautiful.

The *Forest of Dean Stone Firms, Limited* (Row S, 267-8), are preparing the way for an invasion of the London market with the product of quarries situated in different parts of the Kingdom. The Forest of Dean stone has long enjoyed

RUBEROID
SYSTEM OF ROOFING

THE RUBEROID
SYSTEM OF ROOFING
has stood the test of 17 years' actual use, and time has proved it the best, both on boards and concrete. RUBEROID is made in three colours: Grey, Red, and Green. It is suitable for the most permanent buildings, while its low cost makes it an economical covering for temporary structures.

Our new ILLUSTRATED CATALOGUE, No. 7, and SAMPLES sent on application to [1]

THE RUBEROID CO., Ltd.,
81-3 KNIGHTRIDER ST., LONDON, E.C.

Digitized by Google

a very high reputation, but until very recently its cost has more than counterbalanced its merits. This, however, is altered now, and some interesting developments may be looked for. The company offers stone from many different quarries: the Forest of Dean, Ded Wilderness, and Nailsworth stones are from Gloucestershire, the Mount Charles from Co. Donegal, the Keinton from Somersetshire, the Shamrock from Co. Clare, and the Portgain granite from Pembrokeshire. In some cases, as the quarries at Nailsworth and Mount Charles, the amalgamated firms have taken over and entirely reorganised the plant and general working arrangements, so as to ensure any order being properly and promptly obeyed. The former is a cheap building stone which, like the Irish stone, has been little known outside the small radius ordinarily served by the quarries. The crushing strain of the Mount Charles is 772 tons to the square foot, the Kirkaldy test for the Shamrock stone was 2,214 tons to the square foot. In this case likewise the arrangements for supply have been greatly improved. The Forest of Dean Stone Firms, Limited, place all their resources at the service of customers. Their Stand does not show anything conspicuous in the way of architectural carving, but some of the stones have a very old connection with the profession.

The Stand of the *Hempstead Patent Brick Company* is constructed of "Hempstead" hollow porous terra-cotta partition blocks. Though they can be cut with a saw and pierced by nails, a 2½-inch partition wall sustained a distributed floor load of 640 lb. per foot super. The fire-resisting test was equally satisfactory, for a partition withstood uninjured a temperature of 2,786 degrees Fahrenheit—or the melting-point of steel; that is to say, they will absolutely protect any steelwork they cover. Among the buildings where the Hempstead blocks have been used are the Admiralty Buildings, Whitehall; King's College Hospital; Gaiety Restaurant, and Edmonton Infirmary. A sliding fire-proof door with a new protective casing forms one side of the Stand.

In our last week's issue we drew attention to the exhibits of the *Leeds Pottery and Middleton Fireclay Works, Leeds*, Bay 23, in the Gallery. We now give an illustration of a doorway entrance in the "Ceramo" ware, a matt glazed terra-cotta, manufactured by the company. This material is produced in a delicate pearly white, as well as many

shades of colour, and is a material which should commend itself to architects desirous of producing an effective permanent colour scheme. Mr. W. P. Corby, of 11 and 12 Finsbury Square, E.C., is the representative of the company for London and the South of England.

THE "DRAWWELL" GRATE

WAS PLACED

First in the Final Tests

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjunction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public and private buildings.

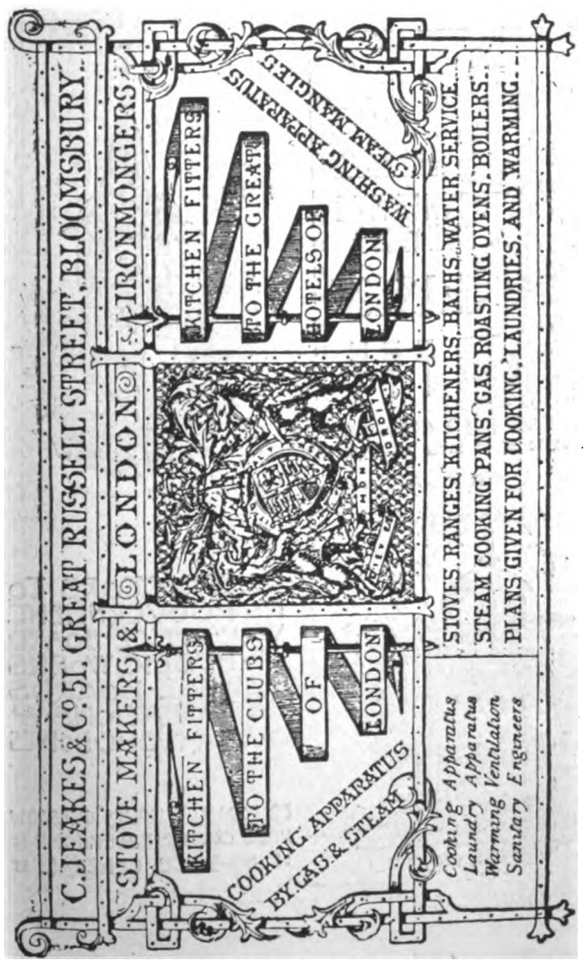
On the Stand of the *Atmospheric Steam Heating Company, Ltd.*, there is shown the Webster vacuum system, which is to be met with in many of the largest buildings in London, including the new War Office and L.G.B. offices in Whitehall, Imperial Institute, Victoria and Albert Museum and Royal College of Science, South Kensington, Caxton House, De Keyser's and other hotels, Debenham's, Ltd., four L.C.C. technical schools, Whiteley's, Ltd., University College Hospital and numerous others, not to speak of the factories, asylums, workhouses, &c., in the provinces. This system is called "atmospheric" because the pressure of steam generally employed does not exceed and may be less than atmospheric pressure. The company do not give tenders for installing their plant, but they put expert advice at the service of prospective clients.

The "Bell" Dog Grates, shown by the *Bell Range and Foundry Company, Ltd.*, are guaranteed not to smoke, and also to give double the heat with half the consumption of fuel by the ordinary dog grate. In addition they are of striking appearance. The "Bell" self-contained boiler is independent of the range. A small size is made for ordinary establishments, and is estimated to cost 3*d*. a day heating a boiler of 50 gallons capacity.

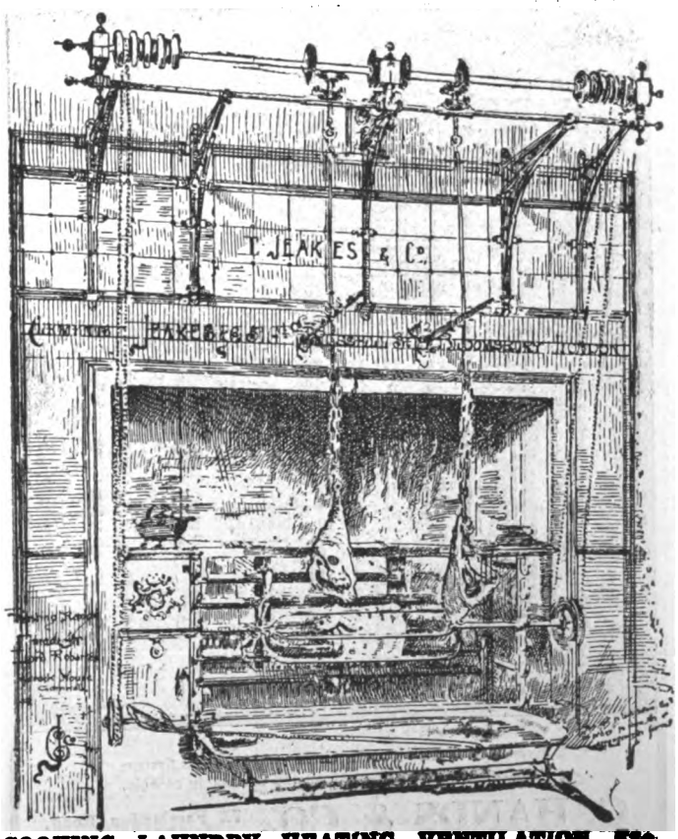
We here illustrate one of the most conspicuous objects on the Stand of *Messrs. Hofler, Ltd.*, No. 83, Row E. It consists of a small staircase and platform, having on one side a length of balustrading of French design in polished steel and bronze of the Louis XVI. period, and on the other wrought-iron balustrading in the Georgian style. At the back are a pair of polished iron gates with Wedgwood plaques. It is gratifying to know that the whole of these beautiful examples of the metal-workers' art have been executed by British craftsmen, at their company's Chiswick forges.

Digitized by Google

The *Guild of Decorators' Syndicate* scarcely do justice at Stand 233, Row O, to the largeness of their scope, although what there is to be seen is of the best. The syndicate are ready to carry out any work in stained glass, metal, furniture designing, sculpture, mural painting, and the like. The interior of the Stand is decorated in the little-used Pompeian style, and would no doubt be about the same size as one of their apartments; but they undertake to decorate and furnish a house in any desired style or period. The coalbox illustrated above, and other metal-work from their own forge would win admiration anywhere. To guard against any mechanical spirit in the working, no two designs are exactly the same. The syndicate are, to use their own words, "a guild of artists and craftsmen who have individually gained a reputation for excellence in some branch of the decorative arts, and are banded together for the purpose of undertaking decorative work of every description in competition with the tradesman." The Associates, who form the "art" side, are Messrs. J. Dudley Forsyth, Henry Batley, E. Owen Clark, Wentworth Huyshe, A. R. Martin, Henry Poole, and W. J. Paulson Townsend. The syndicate have already carried out important work, and their scheme should be of general benefit.



The *Crittal Manufacturing Company* have one end of their Stand closed in by metal shop fronts, and the effect is one that must commend this new departure to any architects who are harassed by the difficulty of conferring distinction on this important part of business premises. There are several kinds of metal casements, including the Fenestra system, which was introduced about three years ago, as something cheaper and yet stronger than its predecessors.



Last week we gave a notice to the exhibit of the Ruberoid Co., No. 101, Row F. Owing to press of matter, we were unable to find space for the view here given of their Stand. It will be seen that the pavilion illustrates the applicability of the material for variously shaped roofs.

The Taroads Syndicate, Limited, keep a large staff of men to execute contracts for the construction of bituminous bound roads and for tar-spraying. To meet cases where the local authority carry out their own work, they manufacture apparatus of simple types such as the Coleman patented tar-spreading machine, type G (price 12*l.* 10*s.*), or the large 1,000 gallon tar-spraying motor machine (price 800*l.*). During last season the Syndicate executed orders for over 150 Councils. One of their most recent contracts was for tarring the main roads, 22 miles long, from Crawley to Brighton. With the advent of warmer weather, the dust nuisance has already come to the front. The Taroads Syndicate are therefore meeting a need of the moment, and should be consulted by all authorities who control the public highways.

C. JEAKES & Co., ENGINEERS, 51, Gt. Russell St., LONDON

COOKING, LAUNDRY, HEATING, VENTILATION, Etc.

Digitized by Google

One of the features of the Annexe is the display by the *India Rubber, Gutta Percha and Telegraph Works Company, Limited*, in Wall Spaces 278-9, of their mosaic india-rubber tiling. The Stand affords one of the encouraging proofs that what was until very recently considered solely from a utilitarian standpoint is now regarded as having artistic possibilities. Rubber flooring received many years ago the warm approval of the profession as being noiseless, sanitary and waterproof, and it has ever since been coming more strongly into favour. But this latest development should give it an impetus unlike anything it has received before. The design of the floor of the Stand and the designs on view put the material in the same category as real mosaic so far as effect goes. It harmonises admirably with a building of marble, granite or stone, and the tiling is adaptable to practically any scheme of decoration. Part of the Stand floor is laid as for a bath-room. In the centre are two large white lilies, with a surround of black and white rubber octagons and square tiles; the remainder of the floor is designed to suit a large entrance hall. The tiles are usually $\frac{3}{8}$ in. or $\frac{1}{2}$ in. thick, with the colour all the way through. They are laid in special cement. The mosaic, like the ordinary rubber tiling, can be laid on any surface. For instance, one of its most extensive uses is for men-of-war, liners, yachts and steamships generally. Among the battleships are *King Edward VII., Dreadnought, Inflexible*, and *Hindustan*; the liners include *Lusitania* and *Mauretania*. The company, however, do not by any means confine themselves to rubber tiling. Their display comprises stair nosing and such general rubber goods as w.c. plugs, closet cones, hose tubing, and steam packing. But the chief attraction for the many visitors is the "Mosaic" tiling.

A new chimney-pot and cowl is shown by the *Chimney Pot and Ventilator Company*, Ashford, Middlesex, on Messrs. Doulton's Stand in the Annexe. The circular pot is fitted with a cowl which is divided into four compartments, each of which is fitted with an aluminium door weighted in the centre. The wind automatically closes the shutter on the windward side so that it cannot make a downdraught. The smoke escapes by the other openings. The top has a removable cover. The Burmer pots and cowl are intended for use in bad situations.

The *Expanded Metal Company, Ltd.*, arranged Stand 76, Row E, to display expanded steel concrete fire-resisting flooring, roofing and walling. In the foreground are sections

of expanded steel concrete as applied to sewers and conduits. The exhibit gives a general idea of the multifarious uses to which expanded metal can be put.

C. H. Norris, Ltd., are to be congratulated on their thoroughness in setting up a charming pavilion to display their different kinds of bricks, and also in obtaining the

design for it from a competent architect. Mr. R. Frank Atkinson, F.R.I.B.A., has made a fine use of pergolas,

which entirely do away with the severity of the plain brick room in the centre. The creepers give the pavilion just the necessary summer-house appearance. The brickwork to the front, sides and columns is carried out in the firm's special varied and broken coloured bricks, 2 inches thick, with a wide white mortar joint. The back and inside walls are in plain sand-faced red bricks, and the window openings in C H N rubbers, which are moulded to shape, and require no

Digitized by Google

rubbing. The floor is laid with large red tiles. The cornice is of wood painted white. It may be added that the pavilion was erected in ten days. It has attracted a considerable amount of admiration, and should be instrumental in raising the general standard of the Stands on future occasions. The original drawing for this pavilion is included in the Architectural Room of this year's Royal Academy.

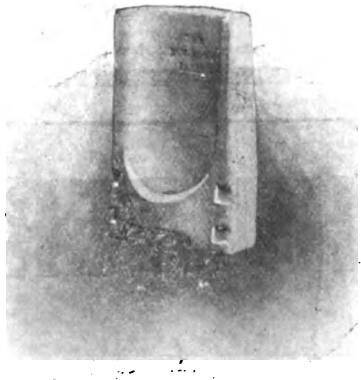
The Stand of *Duggan, Neel & McColm, Ltd.*, shows what can be done with one coat (and only one) of "Dodo" enamel on a properly prepared ground. The panels are in shades of grey "Dodo" flatting, which finishes with an eggshell surface. To get the best results new work should be knotted with a good shellac and filled with "Dodo" filler. After this has dried the undercoating can be applied, and then the enamel.

Messrs. Yates, Haywood & Co. make a series of patent ranges known as the "Quadrant," which are fitted with their self-adjusting lifting-fire, which can be raised or lowered to any point with one hand. One of these is shown together with a "Guinness" range for artisans' dwellings, as well as wood chimney-pieces and interiors.

Messrs. J. T. Phillips & Son exhibit at Stand 205, Row N, their system of low-pressure hot water heating, and known by the name of the "Cable" system, the patentees claim that they can overcome any obstacles and maintain an efficient circulation of hot water in all circumstances and at any temperature, and the system may be applied to any existing building without damage or interference, as no excavations or channelling is required.

Wall-tiling with a dull surface, glazed and antique, is shown to great advantage by *Mintons, Limited*. In "Eburite" dull-surface tiling, which is one of the newer varieties, the decoration is entirely flat, no embossment whatever being used in producing the patterns. Hygienically this has much to recommend it; artistically, also, it makes a pleasant change. The glazed work lends itself to painted figure panels.

One of the newcomers is the *Modernia Patent Glass Tile Company*, who base a claim to be altogether different from the ordinary glass tiles on the fact that they are about ¼ inch thick and are made with a natural backing. Sand blast is used for the surface. The tiles can be made in sheets as large as 5 feet by 2 feet. This does away with cross joints and gives an unbroken pattern. They may be had in almost any colour and of many designs.



Messrs. Tredegar & Co. show an electric-lighting set for small users, and display the announcement that the cost of lighting is at the rate of 25 lamps, each of 16 candle-power, for 1*d.* an hour. The plant is very compact, and of sufficient simplicity to enable an intelligent gardener or stableman to work it after brief instructions. Indeed, the accumulators are especially made for working under unskilled attention. The engines are driven by ordinary petroleum (lamp oil), of which one gallon will give sufficient current to light ten 16-candle-power lamps for seventeen hours. The cost of a complete plant, consisting of engine, dynamo, accumulators (to last a week in summer and three days in winter), switchboard and accumulators for 30 lamps, is 71*l.* 10*s.*; for 50 lamps, 83*l.* 10*s.* Their average price for wiring the house, fixing the plant and fittings for 50 lamps, and giving instruction in running and maintenance, is about 40*l.* The company's "Colonial" system enables the whole of the plant and wiring to be fitted up for temporary uses by unskilled labour. Messrs. Tredegar & Co. have established a sound reputation for their electric fittings, which harmonise with their surroundings. They are ready to embody clients' rough suggestions into their finished drawings.

There are several exhibits of gas from petrol vapour, and in consequence of the brilliant light from these Stands the attention of the visitor has been arrested. The *Non-Explosive Gas Company* at Stand 156, Wall Space, have received a somewhat large proportion of attention, and certainly with some justice. The light, with the assistance of an incandescent burner, is intense, absolutely steady, and free from shadow. We shall hope to give a longer notice of this system in a subsequent issue.

Mr. E. G. Wright is exhibiting at Stand 185, Row K, his Twentieth Century chimney cowl. As there are no revolving parts the inventor claims that it is practically impossible for it to get out of order, and the cowl can be swept as easily as an ordinary chimney.

Mr. James Gibbons has an imposing display at Stand 59, Row D, of door furniture, electric light fittings, &c. A new

VARIETIES.

THE Corporation of Harrogate are about to invite tenders for additions and extensions to the Royal Baths.

THE estimated cost of the new pavilion to be erected at Llandrindod Wells is 10,000*l*. The Local Government enquiry has just been held.

MR. C. HARRISON TOWNSEND, F.R.I.B.A., has removed his offices from Great George Street, Westminster, to 32 Queen's Road, St. John's Wood, N.W.

THE Electric Supply Committee of the Marylebone Borough Council recommend the appointment of Mr. A. H. Seabrook, M.I.E.E., as engineer and manager of the local electrical enterprise, at a salary of 800*l*. a year. There were 128 applicants for the office. Mr. Seabrook is at present enginer and manager of West Ham, and was formerly assistant electrical engineer at Hampstead and Great Yarmouth.

MESSRS. BROWNE & LILLY, LTD., builders, of Fobney Works, Reading, have secured the contract for building a large hotel at Messina, Italy, in spite of the keenest competition of a number of American, German, Italian and English firms. A full staff of men, including Mr. J. Lilly, will be shortly leaving for Messina to carry out the work of erection. The building in question, which was designed by Messrs. Browne & Lilly, Ltd., to withstand earthquake shocks, will contain upwards of 100 rooms, and cover an area of 21,000 superficial feet. It is to be erected in the record time of eleven weeks. After the Valparaiso disaster the same firm were entrusted with a number of relief buildings, which they erected in record time.

AN interesting industrial development is reported in China. The Government have erected cement works on Honan Island, near Canton, on the south branch of the Pearl River. The works are reported to be now complete, and will start manufacturing immediately. On the North River are some large limestone quarries, on the property of a Cantonese confiscated two or three years ago by the Chinese Government, and these will supply the material. A large quantity of cement is required for the construction of the Canton bund and in connection with the railways of the province. The high price of cement in Hong Kong is said to have stimulated the Government to this enterprise. It is intended, besides supplying the Government wants, to place cement on the market for sale. The output is to be 500 barrels per day. The machinery for the cement works was supplied by a German company.

THE Dundee and Arbroath Joint Line Company have accepted the tenders of Messrs. G & R. Cousin, Edinburgh, for the works to be executed under contracts Nos. 1 and 2 in connection with Arbroath Station reconstruction. It is expected that a start to the works will be made at an early date. Contract No. 1 comprises earth work, retaining walls, bridges, platforms, steel work, verandahs over platforms, &c.; and contract No. 2 consists of work in connection with the construction of booking offices and platform building, &c. A large number of contractors, including several Arbroath tradesmen, tendered for the work. It is estimated that the work of reconstruction will cost about 50,000*l*., and it is calculated that the work will extend for a period of two years.

THE sixth annual report of the Metropolitan Committee on Materials and Means of Paving the Streets of London (of which Mr. Deputy Morton, M.P., is the Chairman) has just been issued. The Committee, it may be remembered, was formed in 1903, following a conference held at the Westminster City Hall by representatives of the Metropolitan Borough Councils, to consider the best means of paving the streets of London. The report contains a great deal of technical information concerning the "life" of the various materials for street paving. Mr. Frank Sumner (City Engineer) states that the effect of motor omnibus traffic on the

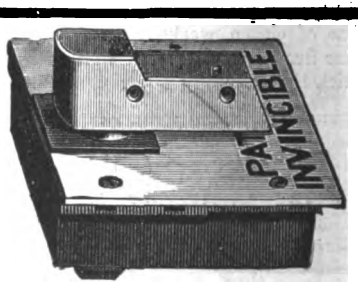
roads is most difficult to assess, but that the various contractors to the Corporation are agreed that the oil from motors is proving detrimental to asphalte pavements.

The Court of Common Council, at their last meeting, considered a letter which was read from the Clerk to the London County Council reporting the decisions arrived at by a conference of City and borough representatives with reference to an abatement of the smoke nuisance. The decisions were as follows:—"That section 24 (b) of the Public Health (London) Act, 1891, which provides that 'any chimney (not being the chimney of a private dwelling-house), sending forth black smoke in such quantities as to be a nuisance,' shall be a nuisance liable to be dealt with summarily under the Act, should be amended by the deletion of the word 'black.'" "That the word 'chimney,' in section 24 (b) should be deemed to include: (1) Openings through which smoke is emitted from buildings or places in which processes of manufacture are carried on, and the chimneys of any building or place where furnaces are used in operations carried on under statutory powers. (2) The chimneys of any Government workshop or factory. That in special cases of nuisance arising under sections 23 and 24 of the Public Health (London) Act, 1891, the proceedings in respect of any nuisance may, at the request of and by agreement with the sanitary authority, be taken by the London County Council in such special cases." The communication was referred to the Sanitary and the Port Sanitary Committee for consideration.

The medical officer of health for Horsham has submitted a lengthy report on the subject of "insufficient" water-closets. He regards any water-closet or drainage system without proper means of flushing as a potential source of danger, and "insufficient" within the meaning of Section 36 of the Public Health Act, 1875. Practically all the artisan cottages in the town, with the exception of those built in recent years, are without flushing cisterns. In 1908 no fewer than eighty-six blocked drains were brought officially to the notice of the sanitary inspector. The medical officer has recommended that "where there is a public supply, the owners of houses be required to provide a flushing apparatus to water-closets, and the sanitary inspector be instructed to report each case of 'insufficient' closet that comes to his notice." The report has been referred to the works committee.



H.M. Consul-General at Hamburg (Sir W. Ward, C.V.O.) has forwarded, under date of March 9, the following memorandum on the German cement trade in 1908, which has been drawn up from information supplied by a leading Hamburg firm engaged in the trade:—"The expectations of the cement industry in Germany formed at the commencement of 1908 were not fully realised, for the results of the financial crisis were everywhere observable, especially in the larger towns. There was a serious falling off in the building trade, particularly in the building of cheap houses, and the owners of factories which were not fully occupied showed little inclination to alter or extend their buildings; consequently large stocks of cement, accumulated during the summer at the cement factories. The latter sought relief in the export market, with the result that the export prices fell quickly nearly 25 per cent. Owing to the demand brought about by these low prices, several of the syndicates disposed of a considerable portion of their stocks. The financial results realised during the year by the German cement works were, nevertheless, regarded upon the whole as good, in spite of the unfavourable state of trade, because the prices, regulated in the interior of Germany by means of agreements between the syndicates, ensured a good profit. These agreements have been renewed for 1909, and among the German cement works there has for several months past been an effort to raise the export prices, which had sunk far below the normal rate. Steps have, moreover, been already taken in this direction and a minimum price has been fixed. . . . Recently the state of trade appears to have shown some slight improvement, and, as money has become considerably cheaper, it is thought that in 1909 there will be an increasing activity in the building trade."

WITH PATENT STOP TO PREVENT OVERWINDING.
The power can be instantly taken off while the Hinges are being fixed and afterwards adjusted to close the door conveniently. They cannot be overwound.
Made in Brass and Iron, 3, 3½, 4, 4½, 5, 6, and 7 inches.

THE Communal authorities of Varna, Bulgaria, have decided to grant to a Mr. Benert a concession for the establishment of a large hotel, which will contain 300 rooms. The cost of construction will amount to 3,000,000 francs (120,000*l.*). The hotel will become, according to the *Board of Trade Journal*, the property of the Communal authorities in fifty years.

TRADE NOTES.

UNDER the direction of Mr. L. A. McDonnell, architect, the Boyle system of natural ventilation, embracing the latest patent "Air Pump" ventilators, has been applied to the Night School, Sacred Heart Convent, Dublin.

THE parish church at South Normanton, near Mansfield, is about to have a new clock which will play the Westminster quarter chimes upon four bells and show time on a large illuminated dial. The work is being done by Messrs John Smith & Sons, Midland Clock Works, Derby.

POPULAR ERRORS ABOUT WATER.

AMONG the popular errors regarding drinking water is that which believes that an ordinary microscope will show countless animalcules in our drinking fluid. This is an utterly erroneous idea. Ordinary water contains no animalcules, but it may contain far more dangerous things in the shape of extremely minute disease germs, such as require the highest powers of our best microscopes to discern. These last are our real enemies, because they are capable of inflicting typhoid fever and other diseases upon us. To remove disease germs from infected water was formerly an impossibility, because common filters possess no such powers of preventing microbes from passing through them. Science has evolved the Berkefeld filters (121 Oxford Street, London, W.), which have been found to yield water absolutely free from all germ life. This power on the part of the Berkefeld filters is warranted by Dr. Sims Woodhead, Dr. Andrew Wilson and other scientists. They have experimented with these filters and have fully tested them. The filters are made suitable for the household, the camp, the factory and the ship. Full details will be sent free on application to 121 Oxford Street, London, W.

THE Penistone Isolation Hospital Committee have resolved to put in an installation of hot water apparatus in place of the ordinary fire grate, at a cost of 227*l.* 10*s.*, such cost to be defrayed out of current expenses.

BUILDING TRADES EXHIBITION.

On Saturday morning last their Royal Highnesses the Prince and Princess of Wales paid a visit to the Building Trades Exhibition at Olympia and visited a number of stands, and, as in his previous visit, his Royal Highness exhibited much patience and interest in listening to the descriptions given to him. The members of the Royal Family have a way of doing the right thing at the right time, and the visit of their Royal Highnesses has given an impetus to the exhibition which is undoubtedly much appreciated by the promoters, the Messrs. Montgomery. We would remind our readers that to-day and to-morrow are the last two days of what may with safety be described as the largest and best exhibition of building materials ever placed before the public of this country. We resume our notices of stands of particular interest. The first notice appeared in our issue of April 16, and a long report will be found in our pages of last week.

The *British Doloment Company, Ltd.*, have been one of the people to profit by the revival of roller skating, for "Doloment" has won favour for rinks. As a material for floor covering for this and other uses it possesses the advantage that it can be laid without a single joint, whatever the area may be. Under ordinary circumstances the thickness is $\frac{7}{8}$ inch, and it can be laid in different colours and patterns. It is fire, vermin and dust proof, and impervious to liquids. The manufacturers strongly recommend its employment wherever the foot traffic is exceptionally heavy. A cheaper flooring is sold for machine shops, warehouses, &c.

The "Venetian" Firegrate and Distributor continues to attract many people to the wall space occupied by *Mr. James D. Prior*. In this, as many visitors will probably remember, a boiler shaped something like a grille and made of corrugated copper tubes, with gunmetal fittings, is fixed at the back of the fire and connected by pipes with radiators in one, two, or even three rooms, with the necessary circulation. Among the improvements since the patent was introduced some three years ago is a greater power in the heat distributor (one of five tubes will heat 80 super feet of radiating surface), and it is also made to fit better. Mr. Prior shows various kinds of radiators, firegrates and boilers, in all of which the aim is to capture wasted heat and turn it to profit.

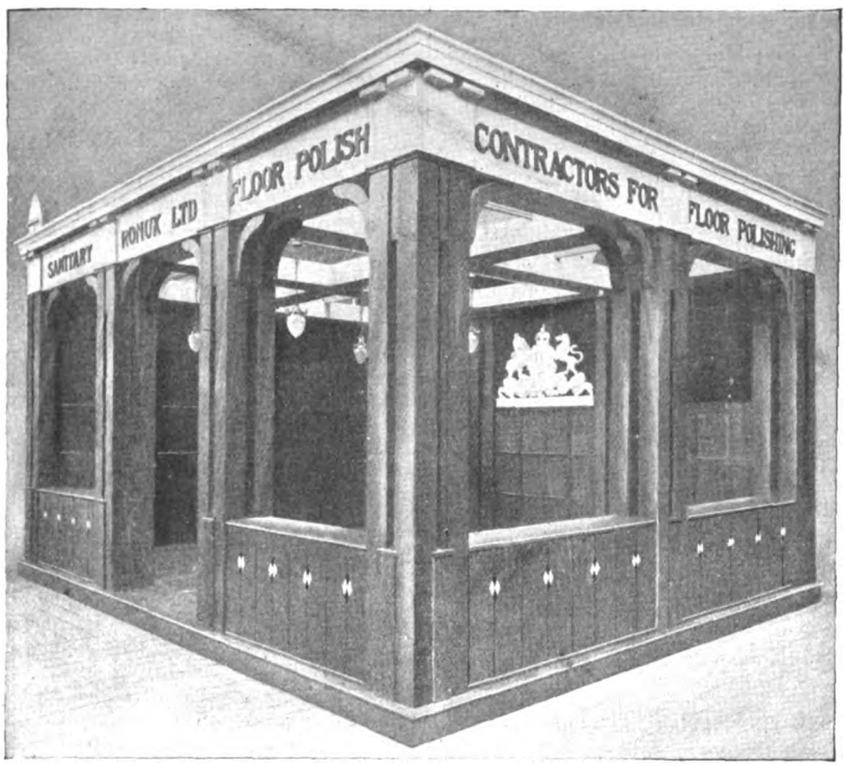
OXFORD COLLEGE SERIES, QUEEN'S.—BACK QUAD AND LIBRARY—BACK QUAD.

Henry Hope & Sons, Ltd., are specialists in metal casements, and have been instrumental in bringing them into vogue for buildings for all purposes and of widely different rentals. For example, their "Garden City" casement has been specially manufactured at a price within the reach of model cottage builders, who were previously prohibited from introducing them on account of expense. The gain in picturesqueness is of course very great. On the other hand, one of their large orders was for steel windows at the new General Post Office. The firm are as ready to quote for windows for public buildings as for cottages. They also make stained glass of excellent designs.



Messrs. Josiah Smart & Son, at Stand 11, Row B, show models representing the method of asphalting roof, reservoirs, &c., and samples of asphaltes in various stages of preparation.

Following the order of the catalogue the Stand of *Ronuk, Ltd.*, in the Gallery is the last to be inspected. But we have litle doubt that to a proportion—the "fair" proportion—of visitors it is one of the few exhibits that they feel at home before. This would no doubt produce a tendency to bold criticism if the Stand gave an opening for it. But it would be a somewhat hard task for a visitor to express anything but admiration for the panelled woodwork, the wood-block floor, the fittings, which have been prepared and polished by the "Ronuk" improved sanitary methods. The material was the result of the increase in use of wooden floors, which called for a surface that was smooth, hard and durable. All these conditions "Ronuk" has fulfilled. The company give estimates for preparing, polishing and maintaining the

Digitized by Google

floors of hospitals, institutions, town houses, &c., and have on their books the National Gallery, Hertford House, the Tate Gallery, St. Bartholomew's, St. George's and St. Mary's Hospitals, and the Manchester City Art Gallery and School of Technology, and other important institutions. The housewife who has to superintend her own cleaning should remember that a little of it goes a very long way, and it might almost be said the less used the better. A "Ronuked" floor should not need any dressing oftener than once in four to six weeks provided that at frequent intervals it is brushed with the special brush and then gone over with a special cloth. The excellence of the results are best demonstrated by the small detached pieces of block flooring on the Stand. The material has the highest medical recommendations. The directions emphasise its sparing use if the best return is desired.

Messrs. Barford & Perkins show the only motor roller in the Exhibition. It is according to their latest pattern. When the hind cylinder is filled with water the weight is 7½ tons. The engines are slow running, and use petrol or paraffin. A patent lifter on the hind axle enables this very compact machine to raise itself out of soft ground. The rollers have during the past five years proved admirably adapted for use on tar, macadam, asphalte and granite repairs. Among the places where it has been used should be included the Franco-British Exhibition.

Samuel Elliott & Sons, Ltd., Caversham, Reading, have a very attractive display at Stand 122, Row G. The most prominent feature is the handsome Austrian oak chimney-

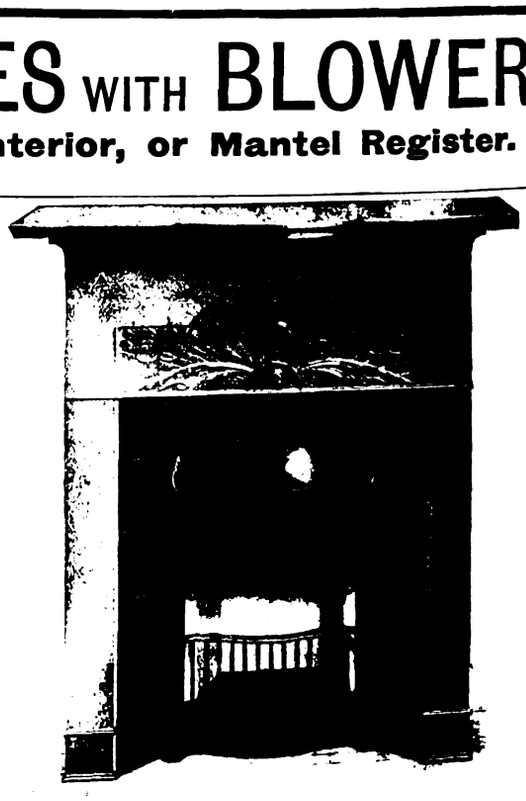
CRAWLEY GRANGE, BUCKS.
Henry Tanner, Jun., A.R.I.B.A.

piece, with inglenook and flanked with panel pilasters. It was manufactured for Messrs. Kidner & Berry, architects, Old Broad Street, E.C. Near it is a Spanish mahogany square cut newel and balusters, with wreathed handrail (this is one of the firm's specialties) and strings. The remainder of the front of the Stand is filled with a very large variety of mouldings in hard and soft woods, all being worked clean and sharp. Ecclesiastical carving is represented by the figure of an angel for the screen at the Roman Catholic church, Caversham—Mr. F. B. Wade, architect. The figuring on the curly pitch pine door placed in one corner has attracted considerable attention. Several photographs record the important work carried out by Samuel Elliott & Sons, Ltd.; they include an oak staircase and panelling at Gaddesden Place, Herts, in which Mr. Cole A. Adams, architect, has got quite a baronial effect; a Spanish mahogany circular staircase wreathed and fully carved, put at Messrs. Osler's premises, 100 Oxford Street—Mr. G. Hornblower, architect; a mahogany door at Westminster Cathedral—Messrs. Bentley, Son & Marshall, architects (this was erected two years ago, and every joint remains perfect); the Capital and Counties Bank in Kensington—Messrs. Kidner & Berry, architects; and other contracts. The back of the Stand exhibits other specimens of high-class joinery and mouldings.

Graves & Co., Ltd., have during thirty years received many testimonials as to the fire-resisting and wearing powers of their patent roofing. A typical instance is one from Mr. J. Dinan, managing director for Eustace & Co., Ltd., Steam Saw Mills, Cork, where they have used the material during twenty years to the extent of many thousands of yards on timber sheds, stores and offices, and have found it most satisfactory. They say that it seemed to improve with age, and requires no attention when properly laid. In a fire by which their saw mill was totally destroyed there were two large sheds full of pine deals covered with the patent roofing, separated from the burning mill by only a few yards. The fire was very fierce, and the boarding and lattice girders of the sheds were several times well alight, "but the fire never extended, being smothered apparently by the air-tight nature of the roofing. Large masses of burning material fell on the outside of the roofs, but failed to ignite the patent roofing. We were so astonished at the extraordinary fire-resisting properties of your material that we covered our new saw mill with it." It is unnecessary for us to supplement such a statement.

"HESTIA" GRATES WITH BLOWER
Register, Interior, or Mantel Register.

(PATENT)



Blower, Swing Canopy and Damper combined.
SIMPLE in **CONSTRUCTION** and **ACTION** (no part can get out of order).
BLOWER is hidden behind canopy when not in use, and when wanted is **EASILY LOWERED** and **REPLACED** (no fastening required).
BLOWER quickens or revives a fire.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

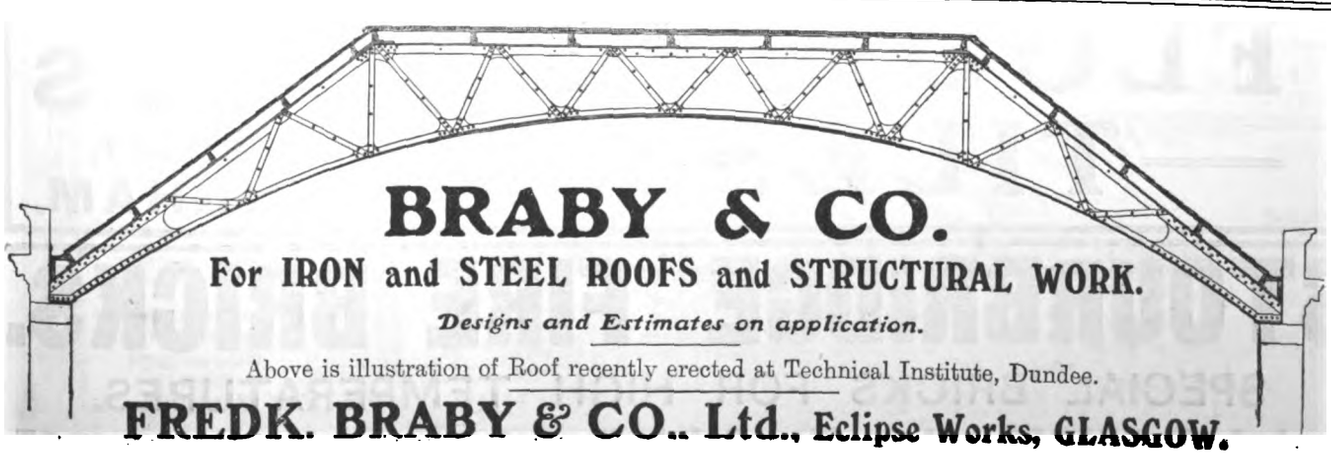
The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.



GLASGOW.—July 31.—The patrons of the Royal Incorporation of Hutchesons' Hospital invite designs for laying out for feuing and building about 195 acres of their lands of Thornliebank, Eastwood. Scagliola Marble

An old Italian process, revived in the early part of the Sixteenth Century by Guido Sassi; is not a surface decoration, but a thoroughly artistic material. It was largely used by the Florentines in some of their most elaborate works, and was introduced into this country by Mr. J. Wyatt about 1750. It has been manufactured by this firm for the last 85 years, and fixed in many of the most important buildings in the Kingdom.

BY SPECIAL APPOINTMENT

TO HIS MAJESTY.

SPÉCIALITÉ for surrounding Iron or Brick Cores.

These being fixed in the ordinary course of construction the SCAGLIOLA can afterwards be fixed round WITHOUT SHOWING JOINT.

Prize Medals, 1851 & 1862.

A DECORATIVE MATERIAL of the RENAISSANCE WHICH HAS STOOD THE TEST OF CENTURIES.

COLUMNS, PILASTERS, WALL-LINING, DADOS, and all forms of INTERNAL DECORATION.

Descriptive Circular on Application.

SAVE 50%
OF YOUR
COAL BILL
BY USING THE PATENT
"Bond" Stove

Recent Testimonial.

Chelmsford, 12th January, 1909.

Dear Sirs,—I have very great pleasure in stating the "Bond" Stoves have given me entire satisfaction, and I have no hesitation in saying, that if I were purchasing stoves for a new house I should, with my present experience, have all the fireplaces fitted with them. Apart from the great heat generated, and thoroughly distributed about the room, they are most economical in coal consumption.—Yours very truly,
(Signed) William F. Gepp.

THE INFLUENCE OF RAINFALL ON THE DESIGN OF SEWERS.*

THE author stated that existing records of rainfall are of little value in settling the provisions that must be made for surface water passing to the sewers, which is generally estimated on the basis of the total rainfall over the whole area to be drained. This method, however, frequently leads to inadequate provision for storm water.

Judging from the report of the Royal Commission on Sewage Disposal, it is not unusual for sewers to serve as land drains also, but it is a mistake to allow the quantity of foul sewage which has to be purified, and in some cases lifted, to be increased by a large volume of subsoil water, and suitable precautions would render this unnecessary.

It will generally be found that the augmented cost of dealing with the larger quantity of sewage would in time considerably exceed the cost of repairing the sewer.

Reference was made to the author's experiments undertaken to enable him to estimate the quantity of rainwater absorbed by various surfaces during heavy storms of short duration, and particulars of some heavy rainstorms were quoted from "Records of British Rainfall," by H. R. Mills, D.Sc., LL.D., the average rate of rainfall per hour in these storms being 3 inches during an average period of seventeen minutes.

Since but few reliable records are kept of the rate of rainfall in inches per hour, the author thought that the frequency of heavy storms may be assumed to be greater than is generally believed, and that the provision to be made for storm water, when designing sewers, should be 3 inches per hour during a period of fifteen minutes.

A detailed illustrative description was given for the purpose of demonstrating the author's methods of estimating the quantities of water which may be expected to find their way into the sewers from (*a*) roofs and yards; (*b*) road surfaces; and the opinion was expressed that in the more densely populated centres the proportion of rainwater from roofs and clean yards exceeds that from roads and foul surfaces.

* Abstract of a paper by C. A. Battiscombe read on Monday, May 3, before the Society of Engineers.

Referring to the use for drinking purposes of rainwater from roofs, as sometimes obtains both at home and abroad, the inference was drawn that this water, if allowed to pass into the sewers, is wasted, while at the same time the cost of purification and pumping (if any) is increased.

As regards the cost of providing a separate system of drainage for roof and surface water, the author considered that the cost would not be prohibitive, while the accruing advantages would be considerable.

INSTITUTION OF MUNICIPAL ENGINEERS.

THE inaugural meeting of the members resident in District No. 6 (South-Eastern District Committee) was held at Olympia on Saturday, April 24, 1909, at 11 A.M., when there were present:—Messrs. Henry C. Adams (London), W. Louis Carr (Ruislip-Northwood), S. J. Higgs (London), P. J. May (Wealdstone), A. J. Meeson (Brentwood), B. Partridge (Walthamstow), J. H. Reay (Hertfordshire), J. W. Riggs (Hertford) and G. Simcox (South Mimms). Mr. Henry C. Adams, having undertaken the duty of calling the committee together, opened the proceedings, and asked Mr. A. J. Meeson, surveyor and engineer, Brentwood Urban District Council, member of Council, to preside. Mr. A. J. Meeson then took the chair.

On the proposition of Mr. A. J. Meeson, seconded by Mr. J. H. Reay, it was resolved that Mr. Henry C. Adams, A.M.I.C.E., A.M.I.M.E., A.M.I.E.E., be appointed district chairman; and on the proposition of Mr. A. J. Meeson, seconded by Mr. J. W. Riggs, it was resolved that Mr. Bernard Partridge be appointed hon. district secretary.

It was decided that Messrs. S. J. Higgs, P. J. May, J. H. Reay, J. W. Riggs, W. Louis Carr and George Simcox be appointed members of an executive sub-committee to arrange visits and meetings in conjunction with the chairman and hon. secretary; and later that, having regard to By-law 22, the chairman, hon. secretary and the executive sub-committee should continue in office until the annual general meeting of the Institution, to be held not later than October 1910, when they would become eligible for re-election.

During an informal discussion it was suggested that the utility of the district meetings would be increased in pro-

WARING'S

(WARING & GILLOW, LTD.)

Beg to intimate that they are prepared under the personal direction of Architects, to

BUILD, ALTER OR ENLARGE

Hotels, Public Buildings, & Town & Country Houses of any size.

The feature of their Constructional Work is Soundness and Stability, combined with Rapidity of Execution.

In Waring's vast New Building, recently opened, there are Departments for everything in connection with either Contract or Private Work, and Architects may be assured that their wishes will be faithfully and carefully carried out by efficient workmen under expert supervision.

Waring's manufacturing resources enable them to satisfy Architects' requirements at the lowest tender prices.

NEAR OXFORD CIRCUS, LONDON.

ALSO AT LIVERPOOL, MANCHESTER, AND PARIS.

Digitized by Google

portion as the district membership increased, and the hon. secretary was instructed to send a list of all the members in the district to each member, in the hope that it might further this object. The hon. secretary was also instructed to ask the members for suggestions for visits to any suitable works in progress in their neighbourhood, and to ascertain the names of those members willing to contribute papers to be discussed at a district meeting to be held in the autumn.

It was proposed that as far as possible visits to works and meetings for the discussion of papers should be arranged in conjunction with District Committee No. 7, in order to obtain larger attendances, which would be to the mutual advantage of the members in both districts.

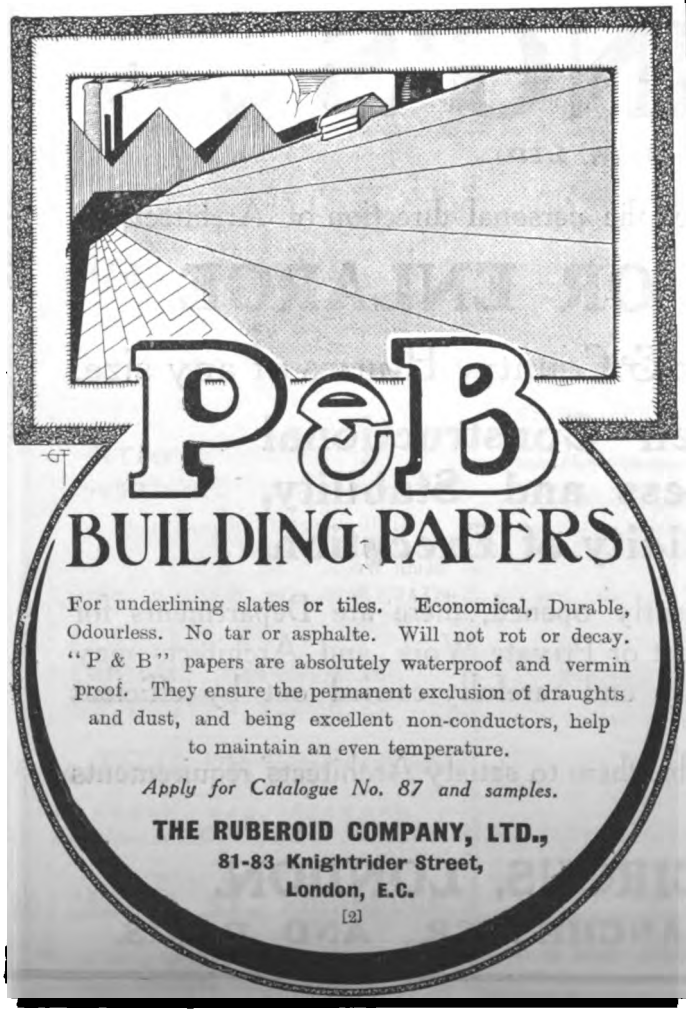
Southern District Committee.—The inaugural meeting for the formation of this committee was held at Olympia, London, on April 24, there being present Messrs. E. A. Stickland (Windsor), Horace Boot (Tunbridge Wells), T. C. Barralet (Godstone), Geo. H. Widger (Godstone), Charles Turton (East Grinstead), G. B. Hartfree (Alton), S. B. Drake (Leatherhead), J. Randerson (Sevenoaks), L. Randerson (Strood), John Marshall (Malling), W. Stephenson Raine (Hungerford), A. H. Jennings (Erith), H. F. Newland (Newport, Isle of Wight), E. W. Ray-Johnson (Uckfield) and E. W. Veale (Farnham)

Upon the motion of Mr. E. W. Veale, who had undertaken the preliminary work of organising the committee, Mr. Horace Boot, A.M.I.M.E., M.I.E.E., was unanimously appointed chairman pro tem., the question of the appointment of a permanent chairman being left until the next meeting. Mr. Veale temporarily accepted the hon. secretaryship.

It was proposed by Mr. Turton, seconded by Mr. Randerson and carried, that London be the central meeting place of the committee for ordinary business, but that upon invitation being extended to the committee by members in varying centres of the district, for inspection of works, &c., the meetings should be held at such centres if so decided.

Upon the invitation of Mr. Horace Boot it was proposed by Mr. Hartfree, seconded by Mr. Ray-Johnson and carried, that the next meeting of the committee should be held on June 5 at Tunbridge Wells. A cordial vote of thanks to Mr. Boot for presiding, and to Mr. E. W. Veale for organising the committee, terminated a very successful meeting.

South-Western District Committee.—A meeting was held at Exeter on April 22 for the purpose of forming the South-Western District Committee of the Institution. The following were present:—Messrs. S. Algar (Exeter), C. Owen Baines (Paignton), J. Hanson (Tiverton), H. A. Hughes (Tiverton), S. Hutton (Exmouth), Thomas Jones (Crediton), Frank Latham (Penzance), T. Orchard (Clutton). Mr. B. Wyand, the secretary of the Institution, attended, and Mr. Latham occupied the chair.



Mr. Latham was elected district chairman, and Mr. Baines hon. district secretary. In order that local representation upon the Council should not be weakened by the fact that Mr. Latham was already a member of the Council, Mr. Hutton was recommended for election on the Council of the Institution, and the secretary was instructed to communicate this desire at the next Council meeting. With reference to the question which was raised of transferring Somerset to the Western District, it was decided to preserve intact the South-Western District, as mapped out by the President of the Institution.

TRADE NOTES.

The Coalbrookdale Company. Ltd., have supplied the Tilt fire to the Duke of Argyll for Roseneath Castle.

Mr. George Coats, of Glen Tanar, N.B., has given an Episcopal church to Aboyne, near Aberdeen, and commissioned William Morris & Co. (Ruskin House), Ltd., Westminster, to supply the windows with glass of the early fifteenth century. The chancel window is richly decorated and strictly to the period, whilst the remainder of the windows are formed of actual old glass collected by the firm for the general filling, and have valuable specimens of Flemish and Swiss heraldic and ecclesiastical coloured glass introduced. The architects were Messrs. Fryers & Penman, of Largs, N.B.

Mr. E. P. Hooley, the Notts county surveyor, has been invited to read a paper before the American section of the International Road Congress at Seattle on tar macadam and the maintenance of roads.

BUILDING TRADES EXHIBITION.

ALTHOUGH the Building Trades Exhibition is now closed there is no reason to believe that it is forgotten by those to whom it was intended to appeal. According to the popular verdict—the jury was non-technical as well as technical—it may be accepted as the most attractive of the series. The number of visitors was very large and included many who were highly welcome to the exhibitors. It is to be hoped that there will be a good harvest to reward the enterprise of the building trades.

We have already given a detailed account of a considerable proportion of the stands; but there still remain one or two which call for a more particular notice than is afforded in the classified list of exhibitors with which we conclude our articles on the memorable Building Trades Exhibition of 1909.

Panels, Ltd., of Birkenhead, produce repoussé work and decorative metal work for use as friezes, overmantels, or other spaces where panels can be introduced with effect. The materials employed are copper or brass or silver. In decoration of this sort there ought to be the greatest possible care in the selection of designs and designers, if it is to win a place in the esteem of architects. The Stand showed one panel in silver (designed, we believe, by Mr. Gilbert Bayes) which is worthy of a place anywhere, and conclusively shows how effective and artistic they can be. By the new methods a picture can be reproduced up to 3 feet by 4 feet, and Panels, Ltd., are ready to reproduce any special design. They have already a very large selection ranging from Classic processions to a twentieth century lifeboat rescue. The work would be particularly suitable for passenger ships, cafés, or hotels, smoking-rooms or libraries. Architects can incorporate the panels in their scheme of interior decoration with most pleasing results.

A few months ago samples of roofing tiles made by the *Nostell Brick and Tile Works*, near Wakefield, were sent to undergo weathering tests in London. We give below the results. A sample when totally immersed in water for twenty-four hours absorbed 0.28 per cent. A sample when totally immersed in water for seven days absorbed 0.33 per cent. A sample when subjected to an atmosphere of damp sulphurous acid gas (after saturation with water) for fourteen days remained unaffected. A sample when subjected to an average temperature of 25.4 degrees frost, being saturated with water and frozen and thawed twelve times remained unaffected. A sample when subjected to an average temperature of 25.4 degrees frost, being frozen and thawed twelve times (dry) remained unaffected. These results are conclusive proof that the tiles are as good as they look. The Stand had a buff terra-cotta entrance doorway. The Nostell Brick and Tile Works, as their name implies, make red and blue bricks as well as plain and ornamental roofing and flooring tiles.

The *Globe Trading Company*, of Haarlem, Holland, exhibited at Stand 214, Row N, Cruyff's patent panic-proof revolving door, which they sold at the Exhibition to the Carlton Hotels Company, Ltd., for the Pall Mall entrance to the hotel. The special features claimed for this new patent are as follows:—This revolving door has distinct and important advantages. It has a safety handle in each of the four panels, which, if pulled down, immediately closes the four wings, whether in action or not. The action of folding up the wings causes the bolt to be withdrawn from the floor, and the whole door can be moved aside in a few seconds. This is a most important advantage, not only in case of panic, but it also enables bulky packages to be carried through and gives free access or exit.

One of the Stands honoured with a detailed inspection by the Prince and Princess of Wales was that of *Messrs. William Mallinson & Son*, and their Royal Highnesses expressed great admiration for the quality and variety of the woods and carving. Part of the Stand was partitioned off as a room for the purpose of showing the excellent effect of an apartment panelled with finely figured Italian walnut. The work was executed from the designs of Mr. H. Tanner, jun., by Mr. H. H. Martyn, of Cheltenham, who carried out the remarkable hand carving shown by Messrs. Mallinson. There were also numerous polished panels of rare fancy woods, and a big stock of seasoned hardwoods selected for high-class joinery in interior decoration and shop-fitting. This Stand received very general attention throughout the exhibition.

The *British Panelling Guild, Ltd.*, are exploiting the Mansfield-Robinson's patents, and should meet with considerable success in putting this form of decoration within the reach of many houseowners who are at present unable to

THE
GREAT CENTRAL RAILWAY
IS
"THE COMFORTABLE LINE."

☞ THE LONDON EXPRESS TRAINS CENTRE ON SHEFFIELD
BRANCHING THEREFROM

WESTWARD to Manchester, Oldham, Stalybridge, Stockport, Warrington and Liverpool;
NORTHWARD to Huddersfield, Halifax, Bradford, Leeds and York;

All Express Trains include Buffet, Breakfast, Luncheon or Dining Cars

TICKETS are issued in advance at all offices, or by Messrs. Dean & Dawson, the Company's Agents, who also book to the Continent by any Channel Service in connection with the Rundreise or Tourist system, which affords travellers choice of route and a reduction of about 30 per cent. off ordinary fares.

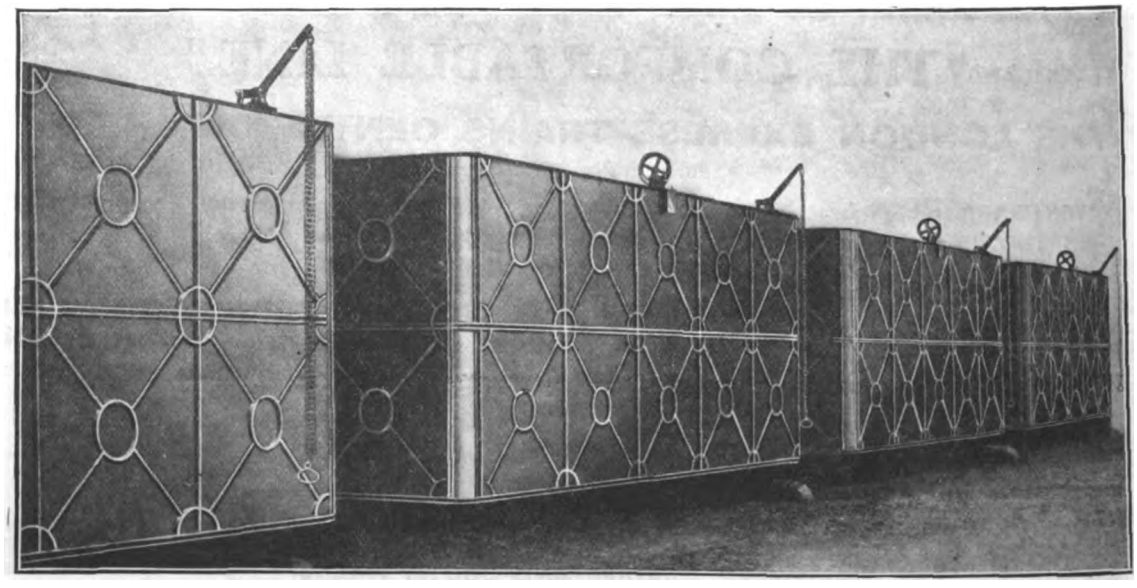
Digitized by Google

indulge their desire for it by reason of the cost. Their inclusive price is 1s. 6d. per foot super in the London district; this, it is important to remember, is inclusive of sterile oiling, capping and skirting rail; or, if moulded, the price is 3d. per super foot more. The panelling requires neither screws nor nails, and can be either a tenant's or a landlord's fixture. One feature of it is the rapidity with which it may be fixed. The system was used in the *Daily Mirror* Perfect Cottage at the Franco-British Exhibition and was awarded a gold medal. It is made at Samuel Elliott & Sons', Ltd., joinery and moulding works, Caversham, Reading.

"Red Cross" brand of Portland cement and "Reinforcrete" are the two products of the *Wouldham Cement Company, Ltd.*, a business which was established in 1855, and has now a weekly output of 3,000 tons from their Lion Works at Grays, in Essex. The company guarantee that the "Red Cross" brand more than fulfils the requirements of the revised British Standard Specification. Messrs. Henry Faija & Co. recently carried out some tests which fully prove this statement. Thus, the residue left after sifting through a 180 by 180 mesh sieve was 13.7 per cent., instead of the 18 per cent. allowed, and when a 76 by 76 sieve was used, the residue was 0.4 instead of 3 per cent. The tensile strain on briquettes seven days and twenty-eight days from gauging averaged 539 lb. and 677 lb. per square inch respectively, compared with the 400 lb. and 500 lb. set down in the standard specification. The sample expanded 3 millimetres, compared with the 10 millimetres permissible after twenty-four hours aeration. The other tests were of a no less satisfactory character. Tests were also carried out on a sample of "Reinforcrete," which is specially manufactured for reinforced concrete work, and with equal success. The Wouldham Cement Company export to most parts of the world, and have their own cooperages where casks are made which render leakage practically impossible.

The *Moule's Patent Earth Closet Co.* were exhibiting at Stand 245, Row P., their new patent pedestal earth closet, with draw-out mechanism. The earth closets of Messrs. Moule & Co. have been before the public for so many years that architects are generally well acquainted with the system.

Cornish granite was shown by *John Freeman, Sons & Co., Ltd.*, who have their headquarters at Penryn. Part of the stand was formed of the granite balustrading and piers in course of erection at the new reservoir at Chingford for the Metropolitan Water Board. The material has been used on several recent London buildings, including the L.C.C. Technical Schools, Southampton Row, New Old Bailey, Embankment Wall, new County Hall, New Scotland Yard extension, &c. The quarries are equal to supplying 500,000 cubic feet of dressed granite a year.



The *Strebel Boiler Co., Ltd.*, had in Bay 5 of the Gallery the hot water boiler "Kennet" and the low pressure steam boiler "Dorchester." These consist of upright O-shaped cast-iron sections connected at top and bottom with push-nipples, making a reliable and elastic metallic joint. They are intended primarily for heating buildings. This make of boilers has obtained very wide popularity by reason of their simplicity and efficiency.

On Monday the *Kleine Patent Fire-Resisting Flooring Syndicate, Ltd.*, gave a demonstration of the effect of heavy loads falling from a height on their floor. A stone weighing 90 lb. was dropped from 10 feet on to the centre of the floor, measuring 20 feet by 12 feet, the clear span between girders being the latter dimension. After repeated falls on the same spot, about 15 inches square, a hole was knocked through, the stone remaining suspended on the tension bands. Similarly a 30-lb. iron shot was dropped from 18 feet on to another part with much the same effect. Against the side of the floor, consisting of one of the 9 by 4 girders, a glass measuring tube was placed, so that any thrust or pressure on the steelwork would break it. A hen's egg was also laid on the concrete surface a few feet from where the stone was dropped, so that the least vibration would crack it. On examination afterwards it was found that every portion of the floor, except the small spaces on which the weights had fallen was unharmed; neither the glass tube nor the egg showed any fracture, and there was absolute cohesion of the cement mortar joints in which the iron tension bands were embedded.

We are unable to find room for a detailed notice of each of the Stands, consequently we conclude by mentioning the names of those exhibitors to whom no allusion has yet been made:

THE NAUTILUS FIRE CO., Ltd.

Sole Makers and Patentees.

"THE BUSH FIRE."

"Always Burning, but Never Consumed."

We place the New "Bush Fire" upon the market after having made practical tests as to its economy and utility. It is made in a variety of simple forms and readily adapts itself to any style of decoration. The Grating goes round the fire-brick and centre brick, forming an island, so that the actual seat of the fire is quite slow combustion; but the ashes fall away from the brick through the Grating, thus leaving a clear slow burning fire. It is fitted with an Ashpan and Ventilator. *Catalogue 7 B on application.*

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

CONTRACTS OPEN.

Received too late for Classification.

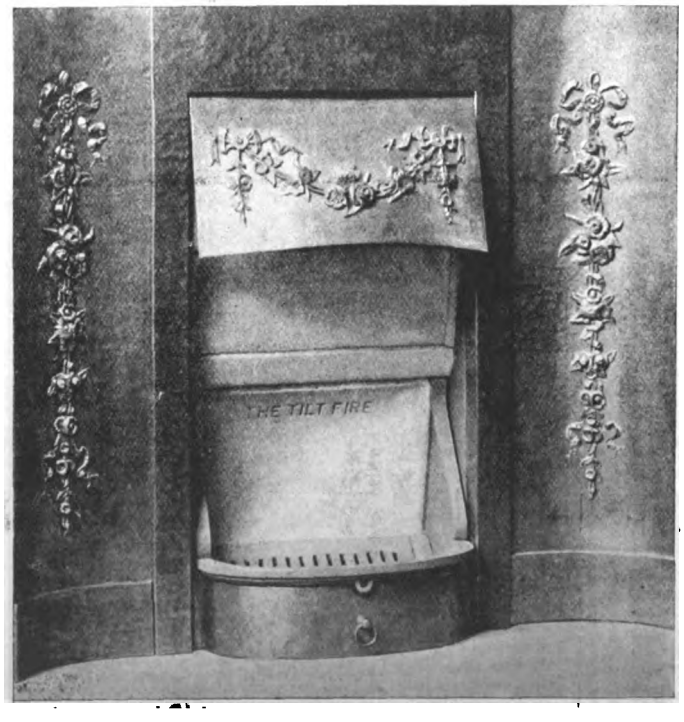
ALBASTON.—May 21. For the erection of a school-room, &c. Mr. W. J. Henwood, St. Ann's Chapel, Albaston.

BRIXHAM.—May 31.—For the erection of a residence adjoining the Berry Head Road. Deposit 3*l.* 3*s.* Mr. F. W. Vanstone, C.E., Palace Chambers, Paignton, Devon.

DARTFORD.—June 15.—For the Kent education committee, for the erection of new secondary school to accommodate 200 girls. Plans and specifications prepared by the committee's architect (Mr. W. H. Robinson, M.S.A.) may be inspected at committee's offices on and after June 1. Names of tenderers and deposit of 2*l.* by May 28. Mr. Fras. W. Crook, secretary, Caxton House, Westminster, S.W.

DUNTON GREEN.—June 12.—For the Kent education committee, new school to accommodate 250. Plans and specifications, prepared by Mr. Wilfrid H. Robinson, M.S.A., the committee's architect, may be inspected after June 1. Applications and deposit of 1*l.* by May 28, to the secretary to the committee, Mr. Fras. W. Crook, Caxton House, Westminster, S.W.

LIVERPOOL.—May 26.—For the erection of an out-patients' department at the Royal Infirmary. Deposit 2*l.* 2*s.* Mr. J. Francis Doyle, 4 Harrington Street, Liverpool.



SCOTLAND.—May 27.—For the internal reconstruction of the Royal Institution, Edinburgh (Contract 1). Deposit 1*l.* 1*s.* The Principal Architect, H.M. Office of Works, Parliament Square, Edinburgh.

SITTINGBOURNE.—June 12.—For the Kent education committee, new school to accommodate 400 children. Plans and specifications, prepared by Mr. Wilfrid H. Robinson, M.S.A., the committee's architect, may be inspected on or after June 1. Applications and deposit of 1*l.* by May 28 to the secretary, Mr. Fras. W. Crook, Caxton House, Westminster, S.W.

WHALLEY.—May 27.—For the erection of three houses, two lodges and eight attendants' cottages at the Whalley Asylum. Deposit 2*l.* Mr. Henry Littler, 16 Ribblesdale Place, Preston.

THE "TILT" FIRE

¶ With the "TILT" FIRE you cannot fail to get a Bright Fire in a Few Minutes

¶ This fire aroused considerable interest at the great Building Exhibition, and when seen will be appreciated.

¶ The tilting arrangement is so simple that there is nothing to get out of order. No other hearth fire has such advantages. Many hundreds already sold.

NEW CATALOGUES.

THE Carron Company have sent us a new heating stove catalogue and a general catalogue which in less than a hundred and fifty pages gives some general idea of the wide range of their manufactures. There is a very large variety of slow combustion stoves, ranging from the severely simple to the type with cast ornamental casing, as well as many other types suitable for multifarious requirements. Certain of the designs are very attractive, as, for example, No. 7A, a hot-air stove. The catalogue description is:—"Oval festoon panel in curtain, hinged fire-doors with bright knobs, ashpan with steel venetians, brick back to fire, self-coloured tiles in side panels, nozzle at top or back." It would be suitable for a hall or ship saloon.

Messrs. Twyfords, Ltd., Cliffe Vale Potteries and Enamelled Fireclay Works, Hanley, Staffs, have compiled Catalogue "A" 1909, for the purpose of showing the principal sanitary appliances they manufacture for colleges, schools, factories and buildings of a similar character. Messrs. Twyfords guarantee their ware and fittings "to be the best in their class, and will replace free of charge any article proved to be of inferior quality or defective in action." The "Adamant" fireclay lavatories are glazed on every exposed surface, and have no crevices for harbouring dirt. This name is given to several patterns of different shapes and sizes, and with different overflows. A special line is the various single and twin ranges for use in schools, &c., as well as trough lavatories and marble or slate lavatories. In the white "CV" ware lavatories the ironwork can be obtained painted, galvanised, white metallic enamelled, or white porcelain enamelled according to price. The manufacture of the basin is only a part of the complete work; Messrs. Twyfords pay no less attention to their fittings and accessories, whether it be a tap, trap or bracket, or anything else in connection with their appliances. For w.c. basins the firm use their "Vitrina" ironstone ware, which is absolutely non-absorbent, and of great strength and durability. For ranges of these, enclosures of cast-iron divisions with pine doors (the whole being fitted into columns and rails) are recommended. The "Adamant" urinals are manufactured with many variations. This admirably arranged catalogue concludes with illustrations and prices of shower, spray, foot, and ordinary baths. Messrs. Twyfords have a firmly established reputation, and there is no fear of their losing it so long as they continue to produce work of the present degree of excellence.

Messrs. J. H. Tozer & Son, Ltd., York Mansion, Westminster, S.W., have issued a "Handbook of Formulæ and Tables, with Explanatory Notes on the Lock Woven System of Reinforced Concrete and its Application to Various Structures." It is, however, something more than a pamphlet of one particular system, for the first fifty pages deal in a broad manner with reinforced concrete as a whole. It is rather remarkable that the first patentee seems to have been aiming at something like what has since developed into the Lock woven system. In 1840 M. Louis Leconte proposed "the use of trusses of iron plates for floors, from which iron rods were suspended to carry a wire meshwork for sustaining plaster, i.e., a sort of elementary reinforced concrete slab." This brief history stops short at 1892 when the material really began its triumphant career. It is followed by several pages of calculations and carefully-drawn diagrams, in which the method of treatment conforms generally to that adopted by the R.I.B.A. joint committee, the German Government, and the by-laws of many American cities. The second and smaller half of the book is explanatory of the Lock woven mesh system. This, as many of our readers are already aware, is a wire mesh reinforcement, in which the tension and transverse wires are knotted at their point of intersection by a mechanical process. A convenient size has proved to be a 5-cwt. roll of mesh which has an average length of 150 feet. The system has proved eminently useful in the construction of floors, foundation rafts, walls, sewers, culverts, and so on. A "side line," so to speak, is the Lock woven continuous wire-fencing—a hard steel wire of great elasticity—which is to be seen at the White City, Shepherd's Bush. In many important buildings the Lock woven mesh system has been introduced with highly satisfactory results.

MR. WILLIAM GEORGE LEANEY, of Southend, builder and contractor, deputy-mayor of the town, left estate valued at 19,398*l.* gross.

RUBEROID GREEN ROOFING

Ruberoid is a high-grade permanent roofing, suitable for all buildings and all roofs. Is made in three colours, GREEN, RED and GREY. The colour is not a painted coat, it is incorporated into the surface of the material during actual process of Manufacture.

Our Illustrated Catalogue No 87 will be supplied on application.

TRADE NOTES.

THE Hempstead Patent Brick Company, of Hemel Hempstead, Herts, have received an order for the supply to the new central offices, Devonport Dockyard, of their patent partitions and casings for stanchions and for the protection of the concrete beams.

ELOQUENT testimony of the value of Skidmore's bent steel safes is to be found in the long list of municipal buildings where they have been installed to safeguard civic valuables, records and documents. It includes Wolverhampton (where the works are), Manchester, Belfast, Omagh, Blackburn, Chelsea, Bournemouth and Norwich. Letters are constantly received from purchasers whose chief consolation when their premises have been partially or wholly destroyed by fire is that the contents of the Skidmore safe have been recovered unharmed.

MESSRS. FREDK. BRABY & CO., LTD., Eclipse Iron and Galvanising Works, Glasgow, are erecting a large roller-skating rink on Bunhouse Grounds, Glasgow. The whole contract has been entrusted to them by Mr. Norman M. Allan, and it includes all digger work, foundations, builder and joiner work, plumber work and steel work, the latter being the greater part of the contract. The trusses are of 75 feet clear span, and constructed of steel on the French truss principle. The columns, girders and bandstand are also steel. The external covering is of corrugated sheets painted red for the roofs, and stone colour for the sides and ends, the interior being painted in sky blue. The frontage is in brick and rough cast, decorated in woodwork. The rink when completed will be one of the finest in the country and the largest in Glasgow (the skating surface being of maple wood and covering an area of 22,000 square feet), and will be magnificently furnished throughout, including tea-rooms, cloakrooms, lavatories, and all other necessary accommodation. Messrs. Braby & Co. have undertaken to complete the contract within sixty days from date of order, which is very smart work considering the size of the building.

MESSRS. L. G. MOUCHEL & PARTNERS have just published Part I. of their handbook under the title "Hennebique Ferro-Concrete Theory and Practice" (price 3*s.* 6*d.*). The contents are thus arranged:—(1) Introduction; (2) General description of the Hennebique System; (3 Fundamental principles of the Hennebique System—(*a*) theory of beam design, (*b*) theory of column design, (*c*) theory of pile design; (4) Concluding Remarks. The letterpress is remarkable for lucidity and for the absence of mathematical calculations. As each point is dealt with a marginal heading is given—a method which helps to lighten the appearance of the text.

THE April number of the *Journal* of the British Chamber of Commerce of Egypt draws attention to the opening in Egypt for door and window fittings, and also for sanitary appliances. English door and window fittings, says the *Journal*, are scarcely known in the Egyptian market. It should be remembered, however, that catalogues in technical English are almost useless for a country such as Egypt, where most architects and contractors belong to other nationalities.

THE Urban District Council for Seaford have passed the plans for a new and extensive drainage scheme.

A NEW hotel is proposed near the Montrose Golf Course. It is intended to float a company with a capital of 30,000*l.*

THE Torquay Town Council have decided to spend between 300*l.* and 400*l.* in providing a new ornamental entrance to the recreation ground.

A SUM of 13,000*l.* is being spent in making new roads and paths at the Shepherd's Bush Exhibition, and 250,000*l.* is being expended on new attractions.

THE Accrington electricity committee has decided to grant a bonus to workmen employed at its works for any saving in production below a certain figure by the use of new appliances which are to be bought.

THE Chertsey Rural District Council are about to make application to the Local Government Board for sanction to borrow 23,975*l.* for the expenses in connection with the Byfleet sewerage scheme.

CHANCELLOR EDMONDS states that there is no foundation for the statement which has appeared in a London paper "that a considerable portion of the roof of Exeter Cathedral, which is the oldest vaulted roof in the kingdom, had sunk some distance." The roof, he explained, leans a little towards the western side, and it has been in that position for about 600 years, and it has not apparently moved during that period.

VARIETIES.

THE Walsall Town Council approved of an amended scheme of sewage disposal at a total estimated cost of 50,000*l*., and will request the Local Government Board to sanction the borrowing of a loan of that amount in place of 62,734*l*. originally applied for.

THE Council of the Incorporated Association of Municipal and County Engineers announce that the Board of Trade have agreed to sanction the change of the name of the Association to "The Institution of County and Municipal Engineers."

THE Urban District Council of Kingstown, Ireland, have appointed a deputation to wait upon Lords De Vesci and Longford with a view to securing a suitable site for a new library. In the event of a site being secured the existing reading room will be used in connection with the new technical schools there.

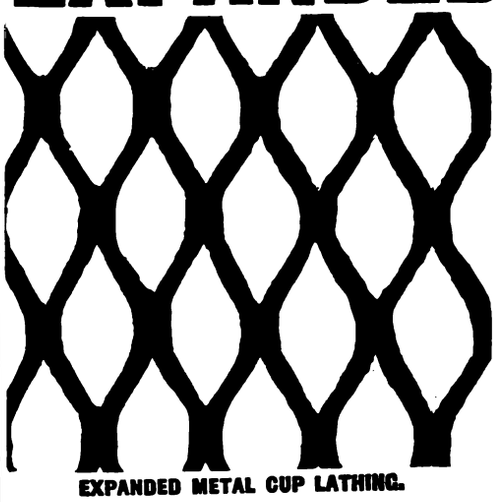
THE Epsom fire-station sub-committee recommend the adoption of a scheme for the erection of a new and permanent fire station at Bromley Hurst, with all necessary appliances, and the fixing of street alarms at an approximate total cost of £2,300. The recommendation was deferred until the next meeting of the general purposes committee.

THE Hornsey Town Council recently instructed their finance committee to advise the Council what is an adequate sum to charge to the Housing of the Working Classes account in respect of management, collection of rents, &c. The committee having had before them an analysis of replies as to their practice, received from other local authorities who have adopted and erected dwellings under Part III. of the Housing of the Working Classes Act, report that an adequate sum would be 1½ per cent. on the total amount of rents collected.

ACCORDING to the *Board of Trade Journal*, a draft Bill has been published for the carrying out of important reforms in the postal and telegraph service of Spain. Arrangements are to be made for the erection of central post and telegraph offices in the various provincial capitals, and also at Carthagena, Ferrol, Gijón, Reus, Vigo, Las Palmas and Mahón. The cost of the latter is estimated at about 839,300*l*.

NEW Sunday schools to accommodate about 600 scholars, in connection with the Conference Hall, Stratford, E., were opened recently. They were designed by Messrs. George Baines & Son, 5 Clement's Inn, W.C., and carried out by Mr. J. W. Jerram, East Ham, under contract at 1,930*l*.

THE electric light committee of the Sheffield City Council, having almost exhausted their borrowing powers for feeders and general mains and services, propose to apply for sanction to borrow 50,000*l*. for the purpose of laying main feeders and for general main extensions and sub-stations, and 6,000*l*. for services.



THE Nottingham City Council have agreed to the construction of a double line of tramway along Carlton Road from Sneinton Market to Thorneywood Lane; and also an additional passing place on Nottingham Road between Sandon Street and Haydn Road. The total cost is estimated at 23,850*l*.

THE Partick Dean of Guild Court last week passed plans for a large extension to the Western Infirmary. The new buildings, which are to cost 30,000*l*., will form an addition to the present west wing, and provide accommodation for upwards of 100 additional beds. The present extension forms part of a much larger scheme, which will probably involve a cost of 80,000*l*.

THE public works committee of Dudley Town Council report that the cost of the proposed municipal high school for girls including site will not exceed 23,500*l*., and the plans, as far as educational requirements are concerned, had been approved by the Board of Education. They recommend that application be made to the Local Government Board for their sanction to the borrowing of this sum for a term of fifty years.

THE Lindsey County Council, Lincs, at their last meeting agreed on the following expenditures:—695*l*. in providing a school at Gunthorpe, 725*l*. in erecting one at East Ferry, 3,900*l*. for an infants' block at Gainsborough Ropery Road school, 1,950*l*. for new school and teacher's house at South Killingholme Haven, 540*l*. for additions to Skegness Council infants' school, 2,300*l*. for additions to Crosby Council school, and 1,475*l*. for acquiring a site at Scunthorpe for a school.

In an action in the Manchester County Court brought by a former tenant of premises in Strangeways to recover gas fittings he had put in, Judge Parry decided that his rights to these were limited. A tenant could remove ordinary gas fittings such as brackets, but not supply pipes substituted for others, and whatever fittings he had a right to must be removed before he gave up the tenancy. He had no right after leaving the premises to re-enter and remove anything without the permission of the owner or his agent.

The Liverpool Philharmonic Society on Monday agreed to reconstruct the roof of their hall at a cost of 6,000*l.* The Society's architects on their periodical examination of the roof of the hall discovered a defect. This was immediately remedied at a cost of 800*l.*, but the city building surveyor declined to certify the fitness of the hall for public use after the present season unless the roof was entirely reconstructed. Mr. B. Hall Blyth, of Edinburgh, was called in to consult with the Society's architects, and a scheme was decided upon, the plans for which have met with the approval of the authorities.

The Makers of Playing Cards Company offer "the Company's prize" of 15*l.* 15*s.* for the best designs for the backs of playing cards, illustrating the subject of England's naval supremacy. The "H. D. Phillips prize" of 10*l.* 10*s.* is also offered by the Company for the best design on any other subject than that mentioned above. The designs selected for prizes are to be the absolute property of the company, and one of them will be reproduced for the pack of cards presented by the Company to its livery and guests at the Master and Warden's inauguration banquet. Designs must be sent not later than June 24 next to W. Hayes, the clerk of the Company, Guildhall, E.C.

THE PRESERVATION OF ANCIENT BUILDINGS.

The preservation of ancient buildings possesses unique interest for the architect, and at the same time presents difficulties which cannot obtain in any other architectural problem.

In carrying out work of this nature, the necessary structural repairs sometimes obliterate historical, architectural, or archæological features of great value, and frequently, owing to the lack of suitable materials, parts have to be renewed when the architect would have preferred to have restored the original, and thus retain that value given to a building only by time and history.

One of the most important, if not the most important remedies for these evils lies in the scientific use of cement. On ancient and historical buildings in Great Britain, like Winchester Cathedral, the "Auld Brig o' Ayr," Glastonbury Abbey, &c., cement under pneumatic pressure is now being used with consummate success. But to obtain such a desirable result the use of a carefully and specially prepared high-grade cement is imperative. Of this nature is the "Cathedral" quality Portland cement. It is made from ideal raw materials and with the most up-to-date machinery, under the supervision of specially trained chemists. It was supplied in the first instance for the restoration of Winchester Cathedral, and since its introduction in 1906, no other make of cement has been used for that work.

An essential feature of cement intended for use in the grouting machine is that it should be exceptionally finely ground, and that the grinding should ensure a large proportion of flour in the finished product. Special attention is given to this point in the preparation of "Cathedral" quality Portland cement, which is sold only in sacks bearing the makers' name, and secured with seals impressed with the registered trade mark "Cathedral." It is manufactured exclusively by the Sussex Portland Cement Company, Ltd., of Newhaven, Sussex.

THE STATUS OF THE MODERN SANITARY ENGINEER.*

Sanitary engineering has in recent years increased to such an important extent, while the character of the work engaged in by those who have adopted the title of sanitary engineer is so diversified, that his position with

relation to other professions and trades has become of a somewhat complicated nature. The time has arrived when some effort should be made to more clearly define both his position and work in the sanitary world, and to classify the various interests concerned.

The Institute of Sanitary Engineers has done much towards obtaining a proper recognition for its own members, and in doing so has at the same time raised the status of the profession generally; but even now its special work and place among other professional bodies is not so clearly indicated as it ought to be.

It is usually considered that the modern sanitary engineer began his existence with the passing of the Public Health Act, 1848, and that a great impetus was given him in his development when the 1875 Act became law. To the minds of many, sanitary engineering conveys little beyond the idea of the removal of excreta and filth from domestic buildings, and is tersely summed up in one word, "drains." Unfortunately, this only too accurately describes the single qualification possessed by a numerous class who, having been employed to lay the drains at a house, immediately describe themselves as "sanitary engineers": and that of others also who, on securing a contract to construct the outfall works at a private residence, blossom forth as "specialists in sewage disposal for country mansions."

Nearly forty years ago Mr. Baldwin Latham, in his standard work on sanitary engineering, defined the sanitary engineer in the following words:—"It is the true aim and object of the sanitary engineer to assist Nature in her great but simple operations, to facilitate the purification of the air, to prevent dangerous impurities entering our supplies of water, to supply abundance of these life-giving elements, to remove, as speedily as possible, before decomposition commences, all those matters eliminated from the animal system, together with all other decomposing refuse."

It was with such conceptions of their duty that the early pioneers of modern sanitation carried on their work. The debt we owe to these men who previous to, during, and after the passing of the Public Health Acts, did such grand work is incalculable. It is the fashion of the present day to sneer at the errors, or supposed errors, of the pioneers in most branches of human endeavour—this is especially so in sanitary matters—yet it is doubtful whether we are progressing in the same proportion as they, considering we have all their triumphs, as well as their few mistakes, to guide us.

When the 1848 Act was passed very few men were qualified to undertake the various works and duties its institution entailed. The demand, however, soon created a supply, and the sanitary engineer appeared. At first he was either a qualified civil engineer experienced in that part of the profession relating to public health, or else a man who had given special study to the subject and made himself an expert therein. After the passing of the 1875 Act, the boom which it created considerably increased the number of those engaged in sanitary work. Not only were there public works of sewerage, &c., to be undertaken, but the proper sanitation of public and domestic buildings was also desired on every hand. These were the days when the professional sanitary engineer flourished. The sanitary surveyor, expert and specialist appeared, and a large number of societies, associations and companies were formed for the purpose of advising on and professionally carrying out works of public and private improvements.

All these did an enormous amount of good in this direction, and they were enabled, in most cases, to induce their clients to undertake works of greater improvement than could be demanded under the Acts then in force; and in every way they proved themselves equal to the task set them under the Acts, and by the public desire for improved conditions. But in many cases, by their over-reaching requirements and exorbitant charges and expenses, they not only brought the profession into disrepute, but quenched considerably the desire for private improvements. The result is that at the present time it is a difficult matter for the professional sanitary engineer to induce his client to believe that the most trivial things are necessary.

There were also engaged in the work at this time some of the most prominent of later-day consulting engineers, who were either in private practice or connected with one or other of the societies, in which they made a sufficient fortune to enable them to leave this part of the work when it became common and less lucrative, and engage themselves only in larger public schemes.

Associated with these were a large body, consisting of

SAVE 50% of your COAL BILL
BY USING THE PATENT
"SINE QUA NON" Kitchen Range.

RECENT TESTIMONIAL.
Gayhurst Cottage, Brentwood.
January 19th, 1909.

DEAR SIRS,—The "Villa Pattern Sine Qua Non" Range you made for us is a great success. It cooks perfectly, and we get any quantity of hot water for bath, lavatory and sink, and the consumption of coal is very small indeed.

The rising bottom is easily manipulated, and as it lifts the fire bodily, it converts it into a grilling stove, and, in my opinion, this is very much superior to the rising fire which hinges at the back. The use of the slow combustion arrangement not only saves a large amount of coal, but is a great comfort to the cook in protecting her from the heat of the fire, and in keeping the kitchen cool. Yours faithfully,
(Signed) J. T. GREEN.

contractors, builders, plumbers, &c., who were employed in carrying out the practical work. These men soon realised that the work was most lucrative, and many of them made it their especial business, and began to call themselves sanitary engineers, until, as at the present time, almost every little builder, plumber, and decorator adopted the title. Consequently, where strict supervision was not exercised, much bad work resulted. Men were not slow in observing that if they could obtain complete control of sanitary works, and be independent of the professional element, their business would become more lucrative still—as there would be no supervision of their work—and they could introduce their own fads without hindrance. So the "consulting and practical" sanitary engineer was evolved, who undertook to do the surveyor's work as well as his own. He succeeded so well in persuading the public that independent supervision was unnecessary that he was not only successful in increasing his own profits, but also in almost entirely obliterating the professional element. Consequently, much of the sanitary work at the present day is done without any supervision whatever, beyond that given to it by the local sanitary inspector; the result is that high prices and bad work in many instances obtain. The professional sanitary engineer of the past is unquestionably much to blame. It is very difficult now to get clients to understand that in endeavouring to save a few guineas in professional fees by calling in a firm to report on the sanitary condition of their property, and employing them to also carry out the works recommended, they lay themselves open to be fleeced in every way. It will no doubt be stated in objection to this that an estimate has usually to be given for the work. This, however, makes but little difference, as where it is so the estimate sent in frequently bears but a very distant relationship to the total account. Another class who of necessity appeared in the early days of sanitary reform is the "manufacturing" sanitary engineer. At first these were ordinary pottery makers employed to manufacture the various appliances patented, or plumbers who had designed some special apparatus of their own. As almost every expert had his own ideas an enormous variety of sanitary appliances were placed on the market. These were improved upon and new kinds were invented, until their name is now "legion." The manufacturing sanitary engineer of to-day is also a patentee of sanitary goods, and the business forms by no means the least portion of that known as sanitary engineering.

The process of development has gone on until the maker of drain pipes is now also a contractor for sanitary works. The manufacturer and merchant of sanitary appliances also undertakes to fit them up and carry out complete all kinds of sanitary and constructional works; and in order to secure that only their own "specialities" are used they now undertake professional work in advising on and submitting schemes for all classes of sanitary improvements. In some cases this is done free of charges. To what extent some of these are qualified as professional sanitary engineers, or even as sanitary engineers at all, is open to question. A few do undoubtedly possess it, but it is by no means desirable that such combined practice should continue, as the absence of supervision leads to the same evils referred to in the case of the "consulting and practical" man. In addition, as these firms use their own appliances, the best results may not always be obtained from the works.

During recent years an entirely different body of persons to those previously described have also included sanitary engineering in their businesses. These are shopkeepers, auctioneeers, and house and general furnishing agents. The only possible reason the public can have for placing this kind of work with such people is the inane desire to deal only at an establishment where everything can be obtained—from a mousetrap to a white elephant. If properly qualified sanitary engineers were always placed at the head of, and controlled, this particular department, and they did better work than those who are in practice as sanitary engineers, one could understand why the public patronise them; but who will be bold enough to declare that this is so?

The house and estate agent also includes sanitary work among his many professed qualifications. Sometimes he appears as a sanitary engineer, at others he is a sanitary surveyor; both words having, in most cases, a similar import, viz., complete ignorance of sanitary science. The surveys are sometimes carried out by a clerk whose knowledge of sanitary work is confined to the information he has obtained through attending a course of lectures on sanitary science at evening classes.

Art Plates from "The Architect."

AWARDED GOLD MEDALS, INTERNATIONAL HEALTH EXHIBITION AND ARCHITECTURAL AND BUILDING TRADES EXHIBITION (1889).

PROOFS on PLATE PAPER of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form on proof paper suitable for framing.

***The Corn Field.*—(1) Ploughing; (2) Harrowing; (3) Mowing; (4) Carting; (5) The Products of the Corn Field.**

In Five Separate Plates. Total Length, 14 ft. 7 in. by 15 in. deep. A splendid example of Colour Work in Permanent Ink Photo. By M. PAUL ALBERT BAUDOIN. This magnificent Illustration was presented to the Subscribers to "THE ARCHITECT," in 1886. A few proofs were taken which immediately became out of print.

OPINIONS OF THE PRESS.—"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition has been issued."—*The Lady's Pictorial.* "They are beautifully done in colours by the permanent ink-photo process and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—*The Stage.* "The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour work in permanent ink photo by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic and would grace the walls of any house."—*The Gentlewoman.* AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates they have been reproduced by Subscription at Half a Guinea the Set, free by post, carefully packed inside patent roller, and are now ready for issuing. Immediate application is requested. May be had framed in Black Reeded Frame with Gold Mounts, price Three Guineas the Set of Five Pieces.

Galatea.

From the Painting by RAPHAEL in the Villa Farnesina, Rome. Size 30 in. by 22 in. Price Two Shillings. Free by post, carefully packed inside patent roller.

St. George.

From the Painting by RAPHAEL, in the Louvre. Size 15 in. by 20 in. Price One Shilling and Sixpence. Free by post, carefully packed inside patent roller.

May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON'S Bookstalls, or from the

Publisher, P. A. GILBERT WOOD, Imperial Buildings, Ludgate Circus, London, E.C. (*FULL LISTS ON APPLICATION.*)

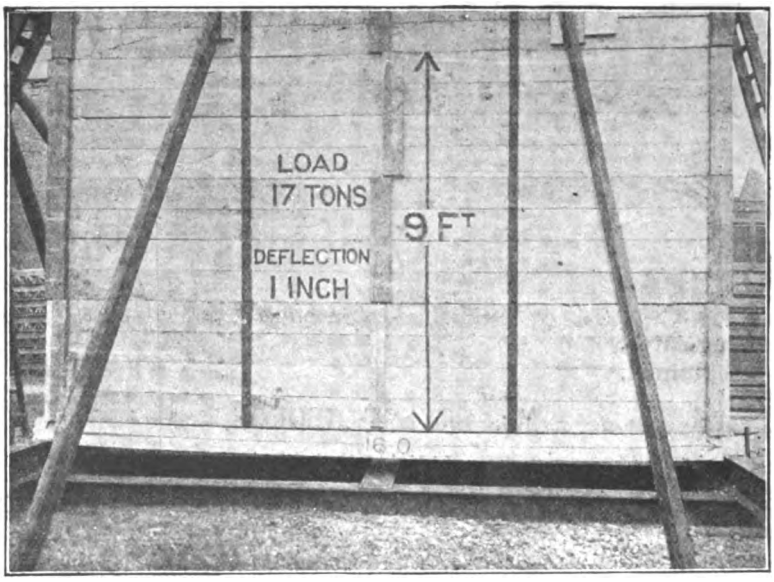
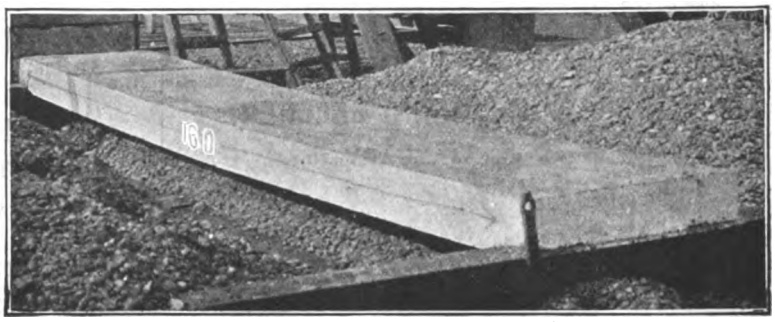
FAWCETT'S MON'LITHCRETE



STEEL GIRDERS

are lattice girders minus compression web members, and in combination with concrete are more than double the strength of joists of equal weight.



For prices per ton and for estimates apply:—

Fawcett Construction Co., Ltd.,

Tunnel Avenue, East Greenwich.

14 cwts. per foot super. on Mon'lithcrete Floor.

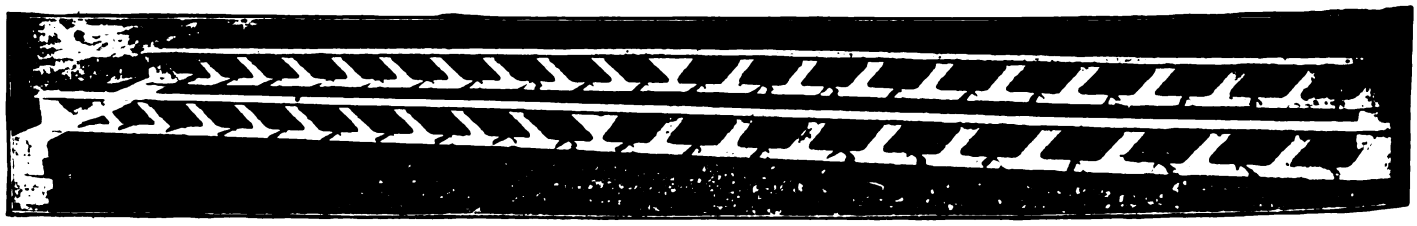
The Floor after removal of the load.

Distributed Load in cwts. that one foot will carry at one-fourth the breaking weight—

(63)

Divide by the span in feet and by the working load in cwts. to find the Spacing in Feet.

EXAMPLE.



Span 15 Feet.

Load 1½ cwts. per foot.

15)63·0(4·2
60
30
30

1·5)4·2(2·8

120
120

Or about 2′ 9″ to 2′ 10″ Centres.

Mon'lithcrete Girders in combination with Concrete are safer than Reinforcing Bars.

"The general results of the tests must certainly be considered as highly satisfactory, and as substantiating the claims put forward on behalf of this method of floor construction in respect of strength and rigidity."—THE BUILDER, February 20, 1909.

"It is claimed for this system of construction that it provides the same safeguard against the expansion of concrete as does the use of reinforcing bars, and this seems to be a justifiable claim, considering how perfectly the concrete is held by passing through the webs of the joists."—THE BUILDING NEWS, February 12, 1909.

"The aim of the inventor, Mr. Mark Fawcett, has been to obtain monolithic construction not by using concrete reinforced by bars and loose or fixed stirrups, but by using what might be described as lattice girders from which the compression members have been removed; in other words, rolled steel girders with large rhomboidal-shaped openings in the webs and tension bars pitched at an angle of 45° to the right and left of the centre, leaving the webs solid at each end to resist shear, whilst the top flanges are reduced to two-thirds the sectional area of the bottom flanges.

"The result is that the steel beams, reduced in weight 40 per cent. from the British standard, are capable of carrying at least 50 per cent. more load. The new floor has besides the advantage that an aggregate, as broken brick, can be used for the concrete, possessing greater resistance to fire and less conductive of sound than ballast concrete ordinarily employed in reinforced work."—THE ARCHITECT, February 26, 1909.

Mon'lithcrete Girders have known strength like ordinary steel joists.

Printed by SPOTTISWOODE & CO. LTD., at No. 5 New-street Square, E.C., and Published for the Proprietors by P. A. GILBERT WOOD, at the Office, Imperial Buildings, Ludgate Circus, London, E.C.—*Friday, May 14, 1909.*

FIBRO-CEMENT COCK BRAND SHEETS AND SLATES

Registered under No. 260,349, January 20, 1904.

PANELLING OF A DINING-ROOM.

The ceiling and panelling of this room, as well as the door casing, mouldings and door panels, are done with Fibrocement.

A panelling of this kind costs less with Fibrocement than if done with wood, as all glueing and assembling is replaced by a simple nailing and the superposition of sheets of various thicknesses.

Compared with wood panels, ours have the great advantage of never "playing" and never giving occasion to numerous joints of paint inevitable with wood panels. Fibrocement never rots. Once fixed to the wall, it in no way loses its shape.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

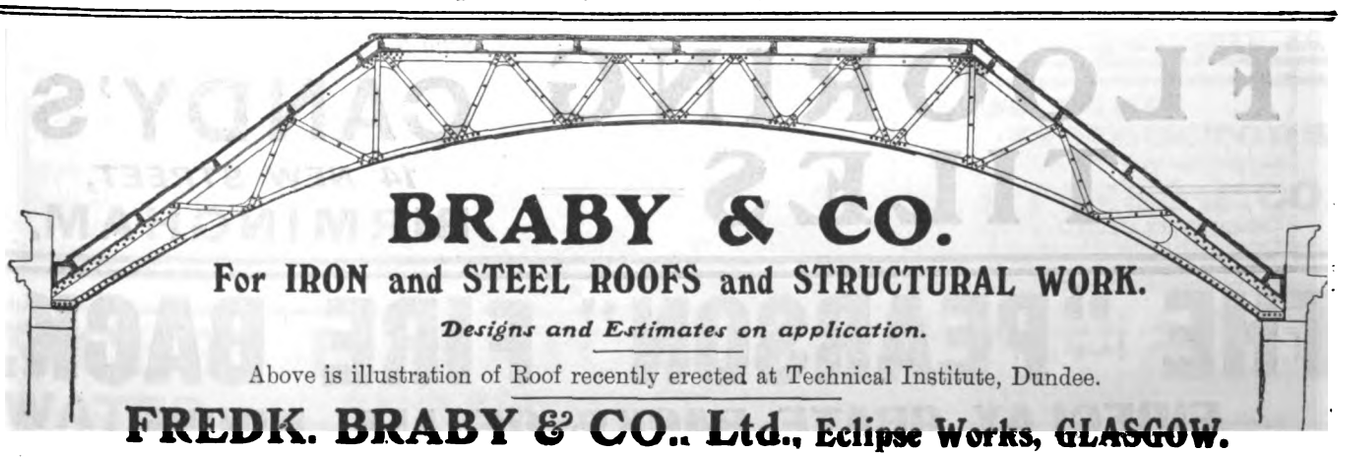
The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BURSLEM.—June 24.—For new public buildings. The author of the design placed first by the assessor will carry out the work. The architects placed second and third will receive premiums of 100*l.* and 50*l.* respectively. Deposit 2*l.* 2*s.* Mr. F. Bettany, borough surveyor, Burslem.



GLASGOW.—July 31.—The patrons of the Royal Incorporation of Hutchesons' Hospital invite designs for laying out for feuing and building about 195 acres of their lands of Thornliebank, Eastwood. Premiums of 100*l.*, 75*l.*, 50*l.* and 25*l.* will be awarded. Deposit 3*l.* 3*s.* Messrs. Hill & Hoggan, 194 Ingram Street, Glasgow.

GRIMSBY.—July 30.—For the extension of the town hall, at an estimated cost of 26,000*l.* Premiums of 250*l.*, 150*l.* and 100*l.* will be awarded. An eminent architect will act as assessor in conjunction with the borough engineer. Deposit 2*l.* Apply to Mr. H. Gilbert Whyatt, A.M.I.C.E., borough engineer, Town Hall, Grimsby.

IRELAND.—June 7.—The Athy Urban District Council offer a prize of 5*l.* 5*s.* for the best plans of three kinds of artisans' houses, to cost 100*l.*, 150*l.* and 200*l.* each. The successful competitor will be offered the carrying out of the scheme at 2½ per cent. on the total cost. Mr. J. A. Lawler, clerk, Town Hall, Athy.

MOLESEY.—June 1.—The East and West Molesey Urban District Council invite plans, with specifications and estimates, for an isolation hospital. Mr. D. Cann, Clerk, Council Offices, East Molesey.

MOSSLEY.—May 24.—For the erection of a mixed elementary school to accommodate 550 children, and an infant

Whalley.—May 27.—For the erection of three houses, two lodges and eight attendants' cottages at the Whalley Asylum. Deposit 2*l*. Mr. Henry Littler, 16 Ribblesdale Place, Preston.

Whitehaven.—May 24.—For all or any of the several trades required in erection and completion of public elementary schools for 712 children, caretaker's residence, &c., in Irish Street. Deposit 1*l*. 1*s*. Send names to Messrs. Oliver & Dodgshun, architects, Carlisle.

Withington (Lancs).—May 26.—For erection of a new "In and Out Home" at the Withington workhouse, for the Guardians of Chorlton Union. Deposit 2*l*. 2*s*. Messrs. Charles Clegg & Son, architects, 21 Spring Gardens, Manchester.

Worksop.—May 25.—For the erection of wood or wood and iron buildings for the treatment of phthisical patients at Kilton Hill, Worksop. The building to be for twelve patients, and must include nurses' room, bathroom and w.c. Mr. James Snow Whall, clerk, 66 Bridge Street, Worksop.

There was an outcry last year at the absence of any representative collection of British sanitary specialities in the exhibition held in the White City, Shepherd's Bush. This omission has now been rectified, for one of the largest sections of the Imperial International Exhibition is the building and engineering constructions committee, with a sub-section for sanitation. Mr. Alfred Burr, F.R.I.B.A., is chairman, and he is assisted by Messrs. H. D. Searles-Wood, F.R.I.B.A., Edmund Wimperis, E. White Wallis, W. H. Prescott, M.I.C.E., Ellis Marsland, M.S.A., and E. R. Palmer, F.I.S.E. Mr. N. W. Hoskins, M.R.S.I., the hon. secretary of the Institute of Sanitary Engineers, is the hon. secretary of the committee. The space allotted comprises 15,000 square feet in the centre of the Exhibition buildings. The Building Trades Exhibitions have proved that the general public are keenly alive to the importance of such exhibits to themselves. The collection at Shepherd's Bush must appeal to a still wider gathering of visitors, and ought to foster a demand for those sanitary improvements in which Great Britain leads the world.

THE "DRAWWELL" GRATE

WAS PLACED

First in the Final Tests

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjunction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public and private buildings.

N.B.—All Grates bear the Trade Mark and Name of "Drawwell" on firebrick to insure against Imitation.

This Grate can only be supplied through Builders' Merchants, Ironmongers, &c., but Drawings and Particulars can be obtained from

J. & R. CORKER, Ltd.,
GENERAL IRONFOUNDERS, Ferham Works, ROTHERHAM.
London Showrooms, Saracen's Head Buildings, Snow Hill, City, W. B. CLARKE, AGENT, where the "Drawwell" can be seen in action.

Kirk & Randall	16,995	0	0
F. & G. Foster	16,982	0	0
Architect's estimate	17,200	0	0

The amounts of the tenders are for comparative purposes only and do not represent the estimated value of the work to be executed, which will be measured and valued on the detailed prices in the schedule of the accepted tender. The cost of the first portion of the building, including incidentals, is estimated not to exceed 11,000*l*., and after adjusting the quantities so as to make them applicable to the erection of the car-shed in question, it is found that the lowest offer is that submitted by Messrs. Kirk & Randall. It is proposed, therefore, that the offer of this firm be accepted.

For the heating and ventilation of the painting shop to be provided at the Holloway tramways car-shed.

TRADE NOTES.

MESSRS. WM. POTTS & SONS, LTD., clock manufacturers, Leeds and Newcastle, have received orders to make and fix a new illuminated turret clock with four large dials at the Royal Free Grammar School, Newcastle-on-Tyne, from the late Lord Grimthorpe's designs. The clock will be a gift from the "Old Boys."

THE City of London workhouse infirmary, Homerton, is being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves with descending smoke flues, Manchester grates, exhaust roof ventilators and patent hygienic inlet ventilating panels, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

THE London office and showrooms of the Marsden Tiles, Ltd., are at 23 Farringdon Avenue, E.C. Here are on view all the usual and some unusual kinds of tiles as employed for walls, floors, stoves, hearths, &c. Some of the effects attained are so dissimilar that it is difficult to believe that identically the same raw material served for them. It is pleasant to see the steady development on artistic lines that is constantly going on, and the ability of science to keep pace with the demands for improvement. It is hardly necessary to say that the clay, from the time when it leaves the pit till it is offered to the architect as finished faience, passes through many processes, which are sometimes complicated and sometimes simple. To achieve success scrupulous care has to be observed throughout, more especially in the attainment of those finer effects through which tiles are winning a high place in the opinion of architects. Marsden Tiles, Ltd., are now making a special bid for the favour of the profession, and to increase their already high reputation, by the production of work of high artistic merit.

THE fire protection arrangements at the Bath and West and Southern Counties Agricultural Show, which opens at Exeter on May 26, have again been entrusted to Messrs. Merryweather & Sons. Their fire station in the yard will be equipped with motor and horsed fire engines, while fire-main piping will be laid down through the grounds, with hydrants at various points; and in addition there will be hand fire-pumps and other appliances for "first aid." A detachment of the Merryweather Fire Brigade will be on duty day and night.

GUIDE BOOKS.

THE Homeland Association, Ltd., have issued two more handbooks—(1) Littlehampton, Arundel and Amberley, and (2) Chelmsford. The first named is, however, the third edition, and it has been brought up to date in many minor details. The letterpress is, of course, admirable; the same cannot be said of many of the half-tone illustrations, which lack sharpness. But this can be easily corrected in the fourth edition. The area embraced is wide, and it is full of interest and beauty. Chelmsford is a town of importance. The opening paragraph of the handbook may be quoted:—"Chelmsford is often cited as an example of a town that has elected to dispense with antiquities; but this is only half true. Its monuments to history must be sought for in the libraries and museum rather than in its streets, for Chelmsford has always preferred to rebuild rather than to bolster up decay. It has steadily refused to sacrifice its present for the preservation of its past. So we look almost vainly for that jostling of the ages among its landmarks which often quite spuriously passes for the essence of the picturesque. Buildings at best are a poor substitute for the spirit of a town." Fortunately there were one or two people who left a few old buildings standing. The neighbourhood also has had much spared which recalls other times and other ways. A third book recently brought out by the Homeland Association, Ltd. (and which like the majority of the series of seventy is sold with covers of paper for 6*d*., and of cloth for 1*s*.), is "Stamford." In this work the importance of the present as against the past is rightly suggested by devoting Chapter I. to "Stamford of To-day: Its advantages as a residential town and holiday centre." The eventful history of the town and neighbourhood is then set forth. A special chapter has been contributed by Mr. E. W. Lovegrove, M.A., M.R.I.A., on "The Churches of Stamford." One of the neighbouring show-places is Burghley House, where the ubiquitous Cromwell left his mark.

The 1909 edition of the Great Eastern Railway Company's "Tourist Guide to the Continent" comes at an opportune period, and it may help many people to put an end to their indecision as to whether or not to go to the Continent this year. The guide is again edited by Mr. Percy Lindley. It gives a "taste" of what awaits the tourist to

Holland, Germany, Belgium, the Tyrol, Switzerland and (a very small taste) Norway, Denmark and Sweden. One addition to the 1909 issue is eight pages of travel-talk in English, French and German. It is unfortunate the replies could not be included to such questions as "Where does this street lead to?" or "Which is the way out?" The answers given by a fluent native are certain to be bewildering.

WHITSUNTIDE ARRANGEMENTS.

To obtain benefit from your holidays there is no doubt that a change of air is essential. The country is now looking its best, and the various facilities for comfortable and expeditious travel should be a further inducement to spend the Whitsun recess away from home. We have just received a copy of the A B C programme issued by the Great Central Railway Company. There are over 300 seaside and inland health resorts in the Midlands and the North, including Liverpool, Isle of Man and West Coast, Cleethorpes, Scarborough and East Coast, which can be reached in quick time at very low fares, and the choice of destination stretches from the Midland counties to the far North of Scotland. To those not wishing to go so far away the Vale of Aylesbury, Chiltern Hills and Stratford-on-Avon should appeal. Those wishing to undertake a walking or cycling tour, visiting the beauty spots of Middlesex, Herts and beechy Bucks, are given a wide range of tours at low fares. Express corridor trains, with buffet-car accommodation, will leave Marylebone on Friday, Saturday, Sunday and Monday, May 28, 29, 30 and 31, and full particulars of times of departure, fares and other information are contained in this programme, which may be obtained free at Marylebone station, any of the company's town offices and agencies, or by post from Publicity Department, 216 Marylebone Road, London, N.W.

RETURN tickets at reduced fares, available for eight days, will be issued to Brussels May 26 to 29 and 31, viâ Harwich and Antwerp. Passengers leaving London in the evening reach Brussels next morning after a comfortable night's rest on board the steamer. For visiting The Hague, Scheveningen and Amsterdam for the cities of the Zuyder Zee special facilities are offered viâ the Great Eastern Railway Company's British Royal Mail Harwich-Hook of Holland route. A corridor train, with vestibuled carriages, dining and breakfast cars, is run on the Hook of Holland service between London and Harwich. From the Hook of Holland through carriages and restaurant cars are run to The Hague and Amsterdam in the North and South German express trains to Cologne, Bale and Berlin, reaching The Hague and Amsterdam early next morning, Cologne at noon, Bale and Berlin in the evening. For the convenience of passengers tickets dated in advance can be obtained at the Liverpool Street station, Continental Inquiry and Booking Offices. The Danish Royal Mail steamers of the Forenede Line of Copenhagen will leave Harwich for Esbjerg (on the West Coast of Denmark) on Thursday, May 27, and Saturday, May 29, returning Tuesday, June 1, and Wednesday, June 2. The General Steam Navigation Company's steamers will leave Harwich for Hamburg on Wednesday, May 26, and Saturday, May 29, returning Sunday, May 30, and Wednesday, June 2.

ON Whit Sunday, Monday and Tuesday, May 30 and 31 and June 1, cheap return tickets for Leigh-on-Sea, Westcliff and Southend-on-Sea will be issued by the London, Tilbury and Southend Company's direct route. The fares are:—First class, 5*s.*; third class, 2*s.* 6*d.* Cheap tickets will also be issued to Gravesend. Friday or Saturday to Wednesday tickets will be issued to Leigh-on-Sea, Westcliff and Southend-on-Sea. Through tickets will be issued on Whit Sunday, Monday and Tuesday to Southend-on-Sea.

THE paving committee of the Dublin Corporation have issued a statement regarding the expenditure on the maintenance of the streets for the past nine years. In the "old city" the expenditure in 1900 on paving, macadamising, flagging, asphalting and concreting, and cleaning monuments was 20,852*l.* 3*s.* 3*d.*, it went down to 12,296*l.* 1*s.* 1*d.* in 1903, and has since risen steadily till it is this year 29,775*l.* 7*s.* 7*d.* The total expenditure under all heads in 1900 was 23,721*l.* 13*s.* 5*d.* It fluctuated during the period, and this year it stands at 39,341*l.* 8*s.* 9*d.* The sum available this year—the estimates having been reduced by the Council—is 20,519*l.*

The Leading Welsh Slate Quarry Owners

Architects are asked to specify Welsh Slates, the finest in colour and durability. The following are the leading firms:

The PRECELLY GREEN SLATES — and — **The PRECELLY RUSTIC SLATES**

VARIETIES.

A HOTEL with about seventy bedrooms is to be erected in the centre of the Marine Drive at Barton-on-Sea, in Hampshire. The promoter is Mr. Humpage.

THE Newport Corporation works committee have decided to purchase a tar-spreading apparatus for the roads, which will cost from 80*l.* to 100*l.*

THE Sheffield master builders are making arrangements for the entertainment of a party of builders from various Belgian towns in August next. Last summer the Sheffield Association paid a highly successful visit to Belgium.

THE Directors of Perth Infirmary have appointed a sub-committee to negotiate with the Glover Incorporation for the purchase of a site at Western Avenue, extending to eleven acres, for a new infirmary.

THE plant used by the Works Department of the London County Council was sold by auction at the Battersea depôt on Tuesday. About 250 lots were arranged and ticketed in the yard and offices, while six barges, of from 28 to 62 tons register, were moored along the river wharf. The total realised was about 2,000*l.*

A SPECIAL meeting of the York City Council was held on Wednesday to receive the recommendation of the tramways committee to accept the tender of Dick, Kerr & Co., Ltd., for the construction and electrical equipment of new lines at a cost of 78,827*l.* After a sitting of three and a half hours the meeting was adjourned till June, in order that further information may be obtained.

MR. HUDSON, the Commissioner appointed by the Board of Trade to act as arbitrator in the dispute between the St. Helens master painters and their employés, which was referred to the Board for settlement, has issued his award. The terms are favourable to the men, though the masters succeed in gaining the point which gave rise to the differences. Mr. Hudson allows that the men should start at 7.30 in the morning, which is an hour and a half later than usual, and which was what the masters desired, their contention being that it was extremely inconvenient to customers to have painters entering their premises so early as 6 A.M. There will in future be no breakfast interval, and in the aggregate the men will work four hours less in the week than heretofore, as the finishing time will remain the same, but as compensation for that loss of time the men are granted a halfpenny per hour extra in wages.

THE Manchester Steam Users' Association have regular and careful inspection made of the boilers at their works. In the year there were as many as 9,044 examinations made of one kind or another. "No boiler under the Association's care burst during the year," the report says, "and at the end of fifty-four years' working the committee with pleasure again place on record the fact that no guaranteed boiler has ever exploded, and that no life has been lost from any cause which the Association could or ought to have prevented." Outside its ranks, however, the Association regretfully records the occurrence of sixty-eight explosions, killing twenty-six persons and injuring forty others. Thirty were boiler explosions proper, and the rest were "miscellaneous," arising from steam pipes, stop valves, drying cylinders, and so on. In addition to the above, seven explosions arose from the bursting of hot-water or kitchen boilers, killing one person and injuring two.

A NEW church is nearing completion at the junction of four roads at Prenton. When completed the church buildings will consist of nave, transepts, chancel, ministers' and deacons' vestries, church parlour, and several classrooms. The walls internally and externally are faced with white Storeton stone, the internal dressings being of red Runcorn stone. The choir is placed in the chancel, the pulpit being on the left and organ in a chamber behind the pulpit. The roof principals, ceilings, internal fittings, doors, screens, &c., are of oak. The church, when completed, will accommodate about 550. The estimated cost of the completed church is about 6,500*l.*, the nave, however, only has been erected at present at a cost of 4,500*l.*, accommodating about 400. The work is being carried out by Messrs. W. H. Forde, Ltd., contractors, of Birkenhead, from the designs and under the superintendence of Mr. T. W. Cubbon, architect, of 54 Hamilton Street, Birkenhead, whose designs were placed first in competition when the existing school chapel was erected.

The Value of a House

Supplied with a Vacuum Cleaning Plant.

The house has an additional attraction in the eyes of the tenant—he at once sees its advantages as a promoter of health, a saver of labour and expense, and a great convenience at all times.

For a Total Charge of £50

we will install a complete vacuum cleaning plant with all necessary fittings for each floor.
These plants can be supplied with either petrol or electric motors, or connected with any steam power on the premises.

The British Vacuum Cleaner
(Booth's Patent)
is the greatest British invention of modern times.
Through our licensees throughout the Continent this, the best system of house-cleaning, has been almost universally adopted.
This is an instance where a British invention has found eager purchasers to a far greater extent in foreign countries than at home.

The Value of Vacuum Cleaning
is universally acknowledged, and the question of expense is solved by the price quoted for a complete installation. The price represents but a small fraction of the cost of the building, and is a permanent investment of greatest value.

The British Vacuum Cleaner
thoroughly removes all dust, dirt, and moth from Carpets, Tapestry, Upholstery, Walls, and Mouldings, without the slightest injury to the most delicate fabrics, and without disturbance to the household.

This is Your Guarantee
We are the only Company possessing testimonials of ten years' satisfactory working, and are now recognised everywhere as the leading and most reliable and successful firm engaged in Vacuum Cleaning—in fact, we are the original inventors of this world-famed Vacuum Cleaning process.

ARCHITECTS are requested to write for full descriptive booklets.

Estimates furnished free.

(Bratt's Patent)

Consumes less fuel, gives more heat, and is better than any other open Fire.

PERFECT IN ACTION.

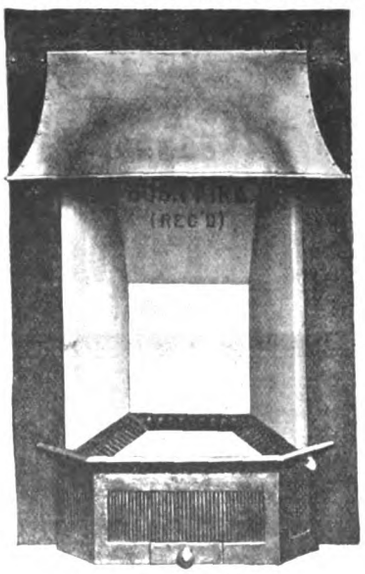
CHEERFUL FIRE.

CLEAN HEARTH.

THE BEST OPEN FIRE

OVER 15,000 IN USE.

Sole Makers:



BRATT, COLBRAN & CO.,

10 Mortimer Street, London, W.

Contractors to the War Department.

THE NAUTILUS FIRE CO., Ltd.

Sole Makers and Patentees.

"THE BUSH FIRE."

"Always Burning, but Never Consumed."

We place the New "Bush Fire" upon the market after having made practical tests as to its economy and utility. It is made in a variety of simple forms and readily adapts itself to any style of decoration. The Grating goes round the fire-brick and centre brick, forming an island, so that the actual seat of the fire is quite slow combustion; but the ashes fall away from the brick through the Grating, thus leaving a clear slow burning fire. It is fitted with an Ashpan and Ventilator. *Catalogue 7 B on application.*

THE

Festiniog District Slate Quarry Proprietors' Association

THE Members constituting this Association, whose names are subjoined, beg to notify Architects and the trade that they are the producers of the genuine **Portmadoc Slates,** and would respectfully invite co-operation in discouraging the sale of other, and inferior, slates as such.

¶ The Members will be pleased to supply Acid, Water and Breakage Tests, with full Analysis; also a list of important Government and public buildings upon which their slates have been used during the past 100 years.

¶ Portmadoc Slates contain, according to analysis, only **1** per cent. of lime, whereas the imitation composite slates, now extensively advertised, show much variation; samples recently analysed contain upwards of **40** per cent. of this highly perishable substance, and are liable to an absorption of moisture **forty** times as great as that of Portmadoc Slates.

Land for New Works

A REGISTER of sites adjacent to the Great Central Railway eminently suitable for the erection of new works or factories has been prepared, and full particulars can be obtained on application to the Company's estate agent,

Mr. J. Oldham,
12 Booth Street,
Piccadilly,
Manchester.

The Railway traverses the extensive coal fields of South Yorkshire, Derbyshire, Nottinghamshire, and South Lancashire, providing an easily accessible source of fuel supply, and is in direct communication with the Metropolis and also the provincial ports and towns of the United Kingdom and the Continent.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BURSLEM.—July 17.—For new public buildings. The author of the design placed first by the assessor will carry out the work. The architects placed second and third will receive premiums of 100*l.* and 50*l.* respectively. Deposit 2*l.* 2*s.* Mr. F. Bettany, borough surveyor, Burslem.

GLASGOW.—July 31.—The patrons of the Royal Incorporation of Hutchesons' Hospital invite designs for laying out for feuing and building about 195 acres of their lands of Thornliebank, Eastwood. Premiums of 100*l.*, 75*l.*, 50*l.* and 25*l.* will be awarded. Deposit 3*l.* 3*s.* Messrs. Hill & Hoggan, 194 Ingram Street, Glasgow.

GRIMSBY.—July 30.—For the extension of the town hall, at an estimated cost of 26,000*l.* Premiums of 250*l.*, 150*l.* and 100*l.* will be awarded. An eminent architect will act as assessor in conjunction with the borough engineer. Deposit 2*l.* Apply to Mr. H. Gilbert Whyatt, A.M.I.C.E., borough engineer, Town Hall, Grimsby.

IRELAND.—June 7.—The Athy Urban District Council offer a prize of 5*l.* 5*s.* for the best plans of three kinds of artisans' houses, to cost 100*l.*, 150*l.* and 200*l.* each. The successful competitor will be offered the carrying out of the scheme at 2½ per cent. on the total cost. Mr. J. A. Lawler, clerk, Town Hall, Athy.

MOLESEY.—June 1.—The East and West Molesey Urban District Council invite plans, with specifications and estimates, for an isolation hospital. Mr. D. Cann, Clerk, Council Offices, East Molesey.

READING.—June 15.—The Berkshire County Council invite designs for offices, committee rooms, &c., on the For-

TRADE NOTES.

THE Stoke-on-Trent Board of Guardians have just accepted the tender of the Brightside Foundry and Engineering Co., Ltd., of Birmingham and Sheffield, for a combined system of water softening and heating apparatus, whereby the water is first passed through a specially constructed water softener (heat principle), and where it is heated by the exhaust steam from the engine and pumps, after which it is circulated through a system of pipes by means of circulating pumps, and the whole of the institution is served with hot water for baths and lavatory purposes and also for heating apparatus. The return water, which is still at a considerable temperature, is then used for boiler-feed purposes, and thus the maximum of economy is effected. Messrs. Edwards & Shaw, of Colmore Row, Birmingham, are the consulting engineers.

THE annual competitions of the South Midland District branch of the National Fire Brigades Union were carried out in brilliant weather, and before a large assembly, in the grounds of Kenton Grange, near Harrow (kindly lent by John Gwynne, Esq.), on Saturday last. Some interesting displays were given with the "Dennis-Gwynne" Petrol Motor Fire Engine, which supplied the water for the competitions by means of the turbine pump; and with the Featherstone Automatic Adaptor for fire hydrants, which attracted considerable attention from the officials, competitors, and spectators alike.

THE parishioners of Barton-under-Needwood, Staffordshire, are erecting a memorial in the church to the late Lord Burton, and part of the scheme is to be an enlargement of the present clock by the addition of a dial on the south side. The work has been placed in the hands of Messrs. John Smith & Sons, Midland Clock Works, Derby, who made the clock itself fourteen years ago.

THE Rye Rural District Council have received the sanction of the Local Government Board and other authorities to carry out a sewerage scheme for Rye Harbour, prepared by Mr. T. J. Moss-Flower, C.E., of 28 Victoria Street, S.W., and Bristol. The matter has been under consideration for some years, and several schemes had been prepared prior to Mr. Moss-Flower being called in a few months ago. The drainage of the district is to be brought to a central spot, passed through a screening chamber, and then raised by centrifugal pumps to a brick and concrete tank sewer on the fore shore. The sewage will be discharged into the sea at convenient states of the tide, through a cast-iron outfall sewer supported on concrete and piles. Owing to the subsoil of the district chiefly consisting of water-logged sand, the ordinary methods of sewer construction could not be followed, and for the most part iron pipes supported on piles driven in on both sides of the trenches will be used. Ventilation will be by means of cast-iron columns and shafts. The work is to be commenced forthwith.

VARIETIES.

The old parish church at Madeley is to be renovated at a cost of 2,000*l.*

Mr. C. Curtis Grey, of Hayes, Middlesex, has been appointed engineer and surveyor to the Scunthorpe Urban Council at a salary of 250*l.*

A large coloured picture, 32 inches by 16 inches, of the great east window at York Minster, reproduced from a drawing by John Haynes in 1736, is now on sale at the office of the *Yorkshire Herald* at 2*s.* 6*d.* each.

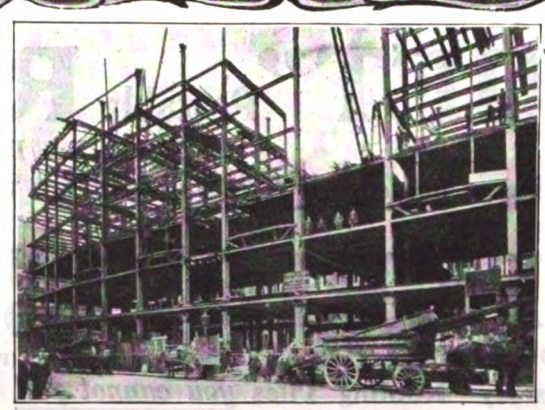
The Chelmsford Rural Council have instructed their engineer to prepare plans and estimates for a covered reservoir at the Great Baddow Works to hold from 60,000 to 70,000 gallons.

The Grimsby Board of Guardians have decided to erect temporary buildings at the workhouse, in accordance with plans which have been submitted to the Local Government Board. An expenditure of a sum not exceeding 833*l.* was agreed to for the above purpose.

Messrs. Young & Co., Ltd., Glasgow, have secured the contract for the construction of a sewer from Pittodrie to Victoria Bridge, Aberdeen, which will complete the Aberdeen general sewerage scheme that has been in progress for the past ten years. The contract amounts to 35,578*l.*

A scheme is on foot to restore the historic West Church in Stirling. The Stirling Presbytery and the General Session of the parish of Stirling have approved of it. The Stirling Town Council have agreed to give a donation of 500*l.* towards the work of restoration.

The Association of Water Engineers will hold their fourteenth annual meeting at Durham on June 10, 11 and 12, under the presidency of Mr. R. Askwith, M.I.C.E. Four papers have been promised, including "The Selby New Waterworks" and "Public Water-supply for Fire Extinguishing."



Mr. A. A. Hudson, who was appointed by the Board of Trade to arbitrate in the wages dispute between the masters and the house joiners in Glasgow and the West of Scotland, has fixed the rate at 9*d.* per hour, being ¼*d.* under the present rate. This reduction, which will take place from July 1, is the third in four years, the total reduction amounting to 1*d.* per hour.

The Hull Corporation propose to lease three acres of land (forming part of the old Stoneferry waterworks estate) to the Digit Disinfecting Company, who intend to lay down plant there and establish their works. The company have the option of purchasing the land at 3,500*l.* within three years from the commencement of the twenty-one years' lease, and at 4,200*l.* at any time during the remainder of the term. The town clerk is of opinion that the sanction of the Local Government Board will have to be obtained for the sale, and application is to be made at once.

The Worcestershire education committee on May 22 considered a report of the general purposes sub-committee, which stated that eighteen tenders were submitted for the building of the new school in Golden Hillock Road, Yardley, and recommended that the tender of Mr. W. H. Gibbs, King's Heath, amounting to 13,380*l.*, be accepted. In the discussion a member pointed out that it had been resolved that, all things being equal, the lowest tender should be accepted, and in this case the lowest tender was 13,241*l.*, that of Messrs. Pattison & Sons, of Birmingham and Lincolnshire. It was finally agreed that Messrs. Pattison's tender be accepted.

The Essex education committee on Monday adopted various reports. The plans prepared by Mr. C. M. Shiner for the erection of a new school at Laindon for 156 children, at a cost of 1,633*l.*, were approved. Plans for a new building at the Braintree Cookery and Handicraft Centre, the approximate cost of which was 800*l.*, excluding fencing and drainage, were approved. Plans prepared by Mr. Whitmore for the erection of the new Council school for 264 children, at an approximate cost of 3,215*l.*, were approved on the accommodation to be provided being reduced to 200, with provision for extension. It was also reported that the Board of Education had approved the plans for a new county high school at Romford.

The Surveyors' Institute, at their forty-first annual meeting on Monday in London, were informed that the proposals for establishing Imperial reciprocity for surveyors had proceeded a step further, and at the request of the Colonial Secretary the Council had drawn up a memorandum comparing the requirements of the several colonies and suggesting a conference of surveyors generally to be held at the Institution.

CHURCH OF ST. EDMUND, KING AND MARTYR, KINGSDOWN, KENT.—INTERIOR.

MAIDENHEAD SECONDARY SCHOOL FOR BOYS.

OXFORD COLLEGE SERIES, QUEEN'S—INTERIOR OF HALL.

OXFORD COLLEGE SERIES, THE BODLEIAN LIBRARY.

This had been forwarded by Lord Crewe to the officers administering the Colonial Governments, with a covering despatch expressing the hope that it would be possible for them to accept the suggestion and to make arrangements for the attendance of one or more representatives. The report showed a total membership of 4,229. Mr. Alexander Rose Stenning, F.R.I.B.A. (surveyor to Christ's Hospital), was elected president for the year; Mr. Leslie R. Vigers, Mr. W. Edgar Horne, Mr. John Farrer, and the Hon. E. G. Strutt being elected vice-presidents; and Mr. T. Silk Wilson and Mr. J. H. Hanson were added to the Council.

THE CARPENTERS' COMPANY.—The following prizes were awarded by the judges for the competitions in connection with the lectures recently delivered on the arts connected with building at Carpenters' Hall:—1. A design for a simple building to accommodate 200 people:—2nd prize, two guineas, Kershaw Peters; 3rd prize, one guinea, Rupert Midworth. 2. "Woodwork":—2nd prize, two guineas, F. J. Bradbeer; 3rd prize, one guinea, J. R. Shackleton. 3. Design for a dining-room:—1st prize, four guineas, F. H. Luhmann; 2nd prize, two guineas, R. H. Flint. The foregoing competitions were open to craftsmen only. 5. Design for a lounge hall:—Prize, four guineas, George Eldridge; extra prize, two guineas, Wm. Park; extra prize, one guinea, Paul Faraday. 6. Essay, with sketches, on timber-built houses of the fifteenth and sixteenth centuries:—Prize, four guineas, Elfric H. Smith; extra prize, three guineas, W. Gandy; extra prize, two guineas, H. J. Chetwood. The two latter competitions were open to all.

THE annual report of the Metropolitan Water Board states that the income for the year ended March 31, 1908, was 3,582,578*l.* and the expenditure 3,197,536*l.* The capital debt of the Board on April 1, 1908, was 47,392,664*l.*, upon which an annual interest charge of 1,425,977*l.* is equivalent to 4.3*d.* per 1,000 gallons supplied. For the whole area the average daily supply per head was 31.55 gallons, or 2.5 cwt. in weight, varying from 33.08 gallons in the western district to 24.48 gallons in the eastern district. Approximately, 51.5 per cent. of the population was supplied from the Thames, 23 per cent. from the Lea, and over 25 per cent. from wells and springs. With regard to the future supply, it is recorded that as the increase in population will eventually render resort to some other source than the Thames watershed imperative, the board views with great alarm the increasing tendency of authorities throughout the kingdom to appropriate water-supplying areas for their particular use, and in these circumstances desires to urge upon Parliament the necessity for regulating the appropriation of water-supplying areas, so that the needs of the metropolis as well as of other populous places may receive due consideration.

AT the last meeting of the Southend Town Council the education committee reported that they had accepted the tender of Messrs. J. S. Hammond & Son, of Romford, at 5,358*l.*, for the erection of a senior mixed department of the Bournemouth Park Road school. The Southend Builders' Merchants' Protection Association wrote protesting against the acceptance of the tender on the ground that three substantial Southend firms had sent in lower tenders. The tenders were:—F. E. Whur, 5,354*l.*; W. E. Davey, 5,321*l.*; H. W. Grainger, 5,184*l.* The committee state that having regard to the fact that Messrs. Hammond had carried out similar work at Southend, they were of opinion that that was sufficient reason for giving them the present contract. The Mayor said he was advised by the Town Clerk that the committee had no power to accept the tender without first coming to the Council, and that they could not incur an expenditure beyond 100*l.* It was moved that the lowest tender be accepted, and a councillor said the builder with the lowest tender had carried out good work in the town. Eventually the whole matter was referred back to the education committee.

EXTERIOR PAINTS.

THE law of evolution may be studied in decorators' materials no less than in higher branches of study, that is to say, there is a constant development or improvement in progress. A most important development, it will generally be conceded, has taken place in connection with enamels. These have been used for many years, but the specimens which still occasionally survive in the interior woodwork of old mansions were the product of seven to ten coats, each being carefully rubbed down, and the whole finally covered with a very expensive varnish. All that is changed now, and enamels are obtainable at a price that permits of their use in the pantry as well as in the salon. Another line of progress is in the variety of uses to which it may be applied, more particularly for exteriors. For use on plaster it possesses the great merit that the surface may be washed down frequently without causing any injury to the surface. Something like a triumph for enamels has been achieved in the East India Avenue, London, E.C., which we illustrate. This was decorated in 1907 with Sanalene white enamel (Aspinall's Enamel, Ltd., New Cross, E.C.), and has just been cleaned down. The following is the report:—"The surface, after cleaning, is as good as new, and will wash again in two years' time with the same satisfactory result." Those who are best qualified to judge have for some few years been confident that enamels would become more and more frequently used for exteriors. The chief obstacle has been the initial ex-

"HESTIA" GRATES WITH BLOWER
Register, Interior, or Mantel Register.

(PATENT)

Blower, Swing Canopy and Damper combined.
SIMPLE in CONSTRUCTION and ACTION (no part can get out of order).
BLOWER is hidden behind canopy when not in use, and when wanted is EASILY LOWERED and REPLACED (no fastening required).
BLOWER quickens or revives a fire.
DAMPER and CANOPY save fuel and completely control combustion.

ARTISTIC, CONVENIENT, INEXPENSIVE.

The "Hestia" Grates hold the Certificate of the Incorporated Institute of Hygiene.

pense, which has daunted householders from using a material for which they expressed unqualified admiration. But this latest test or proof shows that the outlay once incurred is not likely to occur again for an indefinite number of years, and that the surface may be constantly made as good as new at practically no expense. In a narrow avenue such as the one in our photograph the question of light to the offices is of very great importance. The brilliant surface of the enamel, by reflection, increases the amount of light in the rooms considerably. Aspinall's Enamel, Ltd., have therefore good reason to be proud of their "Sanalene," when it can withstand uninjured the chemical-laden atmosphere of the heart of London.

NEW PATENT SAFETY CIRCULAR CUTTER BLOCK.

THE hand planer is doubtless a most valuable machine, and were it not for the danger of using it the value would be still greater, for even the best guard made diminishes the danger but little. The usual practice has been for the

makers to supply square cutter blocks, upon the flat surface of which the plane irons are bolted, and the risk of maiming is of necessity considerable. But with the patent "Ideal" safety circular cutter block (made as illustrated by M. Glover & Co., sawmill engineers, of Leeds) it is practically impossible for any person to incur much damage. Even if the hand should slip upon the round cutter block, it provides its own guard, which revolves with it and which renders it impossible for the hand or fingers to become seriously hurt, because the members cannot become trapped or ensnared by any low places or gaps such as are inherent in the usual square cutter blocks. For reasons of safety alone it deserves the consideration of everyone employing hand planing and moulding machines. But among other advantages are (1) as thin steel strips only are necessary as knives, a great saving in steel and expense is effected; (2) perfect pressure being brought to bear right up to the cutting edge, these blades cut sweeter and with a much better finish; (3) these thin knives are much more quickly and easily sharpened, and are less liable to become unequally balanced; (4) an extra knife is provided (and which is adjustable) immediately underneath the cutting edge of the planer knife, and which serves as the back iron of an ordinary hand plane, and most perfect planing of soft or hard wood is secured. The patent circular cutter block is run with much less power because there is less resistance to the air offered, while it also obviates the humming noise, disturbance, and unpleasant vibration. Heavy cuts can be taken with perfect ease, such as would be a most dangerous proceeding with the ordinary square cutter block.

"THE Old Rectory" at Caversham is to be offered for sale by auction at the Mart on Wednesday. This old residence possesses many historical associations and is reputed to have been the gift of Henry VIII. to Cardinal Wolsey. There is a fine old gateway and an ancient porch of Norman design, surmounted by a carved figure of Cardinal Wolsey in niche, together with the high massive old stone wall, pierced with arrow slits. Previous to the dissolution of the Monasteries, the church and tithes of Caversham belonged to the Augustinian Abbey of Notley or Nutley, in the parish of Long Crendon, Bucks, and at the surrender of Notley in 1538 "The Old Rectory" passed into lay hands, and was owned by families named Browne and Alexander, and it was by the latter that a very interesting old oak staircase, bearing date 1638, which still remains, was presumably built.

SAVE 50% OF YOUR COAL BILL
BY USING THE PATENT
"SINE QUA NON" KITCHEN RANGE.
RECENT TESTIMONIAL.
Brentwood, January 19, 1909.
DEAR SIRS,—The "Villa Pattern Sine Qua Non" Range you made for us is a great success. It cooks perfectly, and we get any quantity of hot water for bath, lavatory, and sink, and the consumption of coal is very small indeed.
The rising bottom is easily manipulated, and as it lifts the fire bodily it converts it into a grilling stove, and, in my opinion, this is very much superior to the rising fire which hinges at the back. The use of the slow combustion arrangement not only saves a large amount of coal, but is a great comfort to the cook in protecting her from the heat of the fire and in keeping the kitchen cool. (Signed) J. T. GREEN.

SATURATION EXPERIMENTS.

The Bombay Government recently carried out a series of experiments for the purpose of ascertaining the saturation of high embankments of storage tanks. *Indian Engineering* in reviewing the record of the results has selected from the several examples described and illustrated two typical ones to indicate respectively the effects of saturation on a bank without rear drainage and on a bank in which provision for drainage is made.

In the Matoba tank the dam is constructed of clayey material throughout, faced only with a thin moorum skin. Five pipes perforated at 1 foot intervals were sunk vertically into the bank and the levels recorded to which water rose in the pipes. A line connecting the highest levels indicates the line of saturation. Saturation attained its maximum on the up-stream face and also towards the base of the down-stream face three weeks after the highest rise of water in the tank. Towards the top of the down-stream face, however, saturation proceeded more slowly, reaching maximum thirty-five days later, by which time the water level had fallen 2.70 feet. It is recorded also that in the following year, 1907, it took sixty-two days for the line of saturation to be reached, indicating probably that a year's further consolidation of the bank had improved its impermeability. At the period of highest saturation there was only 2½ feet depth of dry material near the outer toe, and it is not therefore surprising to learn that on one occasion a slip has occurred here.

The Unkal tank dam has been constructed with selected material throughout, care being taken to have a good draining composition in the down-stream section. The central part of the dam has the most clay in its composition, while the down-stream section has the least. The line of saturation accordingly takes a special course. In the first section it begins with what would be a normal slope, but is deflected upwards as it approaches the line of junction with the middle section. This is obviously because the middle section containing the most clay is the most open to saturation. In the middle section itself the line approaches the horizontal in the first half, but in the second half dips to the junction with the third section. It is apparent that free drainage through the third section has kept the water level down, that the low water level at the junction of the middle and third sections has influenced the level in the second half of the middle section, and that the resulting line of saturation takes a dip instead of being more or less horizontal as in the first half. In the third section in consequence of good drainage the line of saturation keeps quite near the base; and as a fact it had been found to vary but slightly between June and December. Observation of the dates on which the highest water levels were reached in the various pipes shows that it took very little time to saturate the bank to its maximum.

The general results of these experiments may therefore be summed up as follows:—

1. Clay banks are more completely saturated than well-drained banks.
2. Clay banks are more slowly saturated and part more slowly with their water of saturation.
3. In high-banks it is unsafe to have nothing but clayey material, a down-stream section of well-drained material being essential.

The general purposes and building committee of the National Museum of Wales held last week a meeting at the House of Commons. The three assessors who will advise the Council with regard to the new buildings to be erected for the purposes of the Museum in Cathays Park were present. They are Sir Aston Webb, R.A., Mr. J. J. Burnet, of Glasgow and London, and Mr. Edwin T. Hall, nominated by the President of the Royal Institute of British Architects as third assessor. Draft conditions and instructions for the information of competing architects were carefully discussed, their further consideration being postponed until the assessors are in a position to meet the committee on the ground at Cardiff. When the final arrangements are completed, it is understood that architects without any reservation may send in sketch plans in black and white of the buildings required. From the competitors who send in designs not less than five and not more than ten will be selected by the Council with the advice of the assessors, and these will be invited to submit detailed plans on a larger scale, from which the final selection will be made.

THE "HOLLYMAN" PATENT WORK BENCH.

THE most striking improvement of the "Hollyman" patent work bench on the old type is the patent gripping attachment, which, with the front edge of the bench, forms a most useful and reliable instantaneous vice. It dispenses with the old bench screw, as all boards, battens, &c., after being clamped, are held in an upright position and are evenly and rigidly gripped on both sides and along their whole length. The action resembles that of a parallel ruler. When the work is inserted it becomes immovably fixed by the wedge-shaped front end of the sliding jaw being pushed forward (as illustrated) until it engages with a corresponding recess, while at the back end there is a projecting arm underneath, working in a slot in a direction parallel to the angular recess, which controls the movement of this sliding jaw.

Immediately under the front edge of the bench top, and at intervals, are wooden supports, each turning on a screw centre, which can be made to project below the opening of the vice to form a base for supporting work, thereby making it quite impossible for wood to slip down when under pressure of a plane, hammer and chisel, &c., even if the edges of two or more pieces are being simultaneously planed together.

The work is released by withdrawing the sliding jaw by a knob. Along the inner edge of this sliding vice is a rebate, convenient for supporting laths, mouldings and any work narrower than the thickness of the bench top. The projecting batten (at the back end of the bench, and on which the back end of the slide rests) has a step cut to prevent wood, when being planed backwards, from slipping out. The holes in the side are for taking pegs (supplied with the bench) to support boards of various widths when being planed, holes being bored, &c.

There are two bench stops, front and back. The front stop (Hollyman's improved, registered) is of conical shape, about 2¼ inches long, having teeth round the larger end. It revolves eccentrically upon a steel spindle let lengthwise into the bench and can be instantly adjusted to the desired height by moving it round with thumb and fingers. These rotary stops can be fitted to any bench. The back or tail stop (Hollyman's improved, registered) is used in conjunction with the sliding parallel vice. It is formed of a piece of T iron about 4½ inches long, the upper part having teeth at one end, while the "stem" is that part which the patent vice grips firmly at any required point along the bench.

There is a trough for tools, &c., and as the bottom of this is not a permanent fixture it can be brought flush with the bench top, thus widening bench. For holding tools there is a rack at the back, a tray below, and at the front end a drawer which, if an instantaneous grip metal vice be required to be fitted to the bench, should be removed for that purpose.

These benches are made in any size from 66 inches long, 24 inches wide and from 30 to 34 inches high. They should be particularly suitable for technical schools and institutes, for which double benches are constructed for two students to work at. They are installed already at the Acton and Chiswick Polytechnic (Middlesex education committee). A small bench top with the patent vice and the two stops is made for clamping to an ordinary bench or kitchen table for the use of amateurs.

The bench may be obtained from the inventor, Mr. J. H. Hollyman, at 457 Chiswick High Road, W.

MR. JOHN YOUNG, surveyor to the Ayr Dean of Guild Court, reports that the plans passed by the Court for the year to May 15 were valued at 31,797*l.*, as follow:—Dwellings (22), 7,245*l.*; business premises (25), 16,662*l.*; alterations (27), 4,790*l.*; minor warrants, 3,100*l.*

THE STATUS OF THE MODERN SANITARY ENGINEER.*

(*Concluded from page* 24, *May* 14.)

Some of the old-established, high-class surveyors and valuers are no doubt qualified to undertake all kinds of survey work, and to advise on general sanitary improvements to property; but the ordinary house agent belongs to a different class altogether. Before being allowed to practise as professional sanitary engineers they should be obliged to pass a qualifying examination, and should then be debarred from doing the practical work in connection therewith. When they are builders they should not be allowed to do the professional work, but be compelled to prove that they are capable of undertaking the practical work before being allowed to do so, and that they employ fully competent men in each trade concerned in the work. Such a course would raise the status of the profession in the eyes of the public very considerably.

The profession of sanitary surveyor is still further degraded in the present day by plumbers and painters undertaking to survey and report on drainage arrangements. The extreme modesty of some of them is manifested by their circulars, in which they ask the small fee of from 5*s*. per house for doing this.

A few years ago the sanitary engineer was looked upon as a kind of "glorified" plumber; he still is so by those who are only acquainted with the counterfeit of him. Thanks, however, to the educating influences which have been at work the stigma now only applies to those who have not put themselves in the way of knowledge.

The great work done by the Royal Sanitary Institute during the past thirty years, both in educating the public mind and in training those engaged in sanitary work, cannot be overlooked or over-estimated whenever attention is directed to this aspect of our subject. They are not, however, an engineering body (although all the most prominent sanitary engineers of the past and present are, or have been, numbered among its members and supporters), therefore, its work concerns us only in this connection in the present case.

The Institute of Sanitary Engineers, founded in 1895, has also done much to gain for its members proper recognition, and to raise the profession generally to a higher level of efficiency. Unfortunately, in the early days of the Institute, while its promoters realised the advantages of such an association, they did not use discretion in admitting men to membership; the result was that many unqualified persons gained admission, and it appeared likely that the Institute would do little good. However, a few soon realised that if the Institute was to become a real power for good they must eliminate from their ranks those unqualified persons. And as far back as 1889 Mr. James Farley announced, at the annual dinner, "The present Council have no sympathy whatever with the actions of the promoters; we intend to have all that is good, and take out all that is bad." Since then the Institute has made steady progress, and by its efforts the title of sanitary engineer has become an honourable one, and one that is being recognised, when borne by a member of the Institution.

There is a further body of professional men who really come within the category of sanitary engineers; these are the engineers to local authorities. Much of their work is essentially of a sanitary engineering character. It is worthy of notice that this Institute now numbers many of these among its members.

There is also that important body of men in private practice who are engaged in designing and carrying out public works of sewerage, water supply, &c., and who act in an advisory capacity generally. These are the consulting engineers, and may fittingly be described as the aristocracy of the sanitary engineering profession. They include all the best talent and most expert minds engaged in public health work.

It is therefore evident that a great variety of interests are included in the term sanitary engineer at the present day. Broadly, they are divided into two classes—professional and practical—but, as has already been shown, they

now so overlap each other as to be in many cases indistinguishable unless one has some acquaintance with the qualifications of the party concerned, or knows the kind of business he is engaged in. This is even then somewhat difficult.

Such a variety of talent ought to be flattering to the profession as showing how important their work is considered—in that it appears so attractive to all professions and trades. On the other hand, it indicates that the title must be one to conjure with in matters of business, otherwise all these people would not be so eager to adopt it. In fact, all kinds of trades have, and are still, adding sanitary engineering to their own. This is usually stated to be entirely a question of competition. Every one quite realises the keenness of competition in the present day. But in the cases referred to the desire evinced is not to secure a share of the food provided, but to steal the half loaf from a neighbour and leave him without bread. The professional sanitary engineer of to-day has not only to compete with others who are also in practice, but with practical men who also undertake professional work. His sphere in connection with public works is further restricted by local authorities, who, in many cases now, carry out their undertakings with their own staff. He has also against him those engineers and surveyors to local authorities who, in addition to their official duties, carry on a private practice as well.

One cause of the keen competition in the profession, and which also accounts in a great degree for the various classes found in it, is, that at the present time all kinds of men, or any firm, can style themselves sanitary engineers without any qualification whatever, either in profession or trade.

It is one of the objects of our Institute, and should be made more especially so than it now is, to alter this state of things, and secure by legislation, or otherwise, that only fully qualified persons shall be allowed to use the title.

The very pertinent question may be asked, Why should the sanitary engineer be allowed to practise in that which may prove to be against the public health without a proper qualification any more than the doctor who has to cure the patient?

One of the curious features connected with sanitary survey work is that not many years ago, when almost every place was in such a glaringly insanitary condition that the merest tyro could prove it so and safely condemn it, only men of experience and position were employed. Now, however, when the easily discovered defects are things of the past, and the dangers to health are of a more intricate nature, any one is called in, from the house agents' or builders' clerk to the plumbers' mate, and is considered qualified to make an inspection.

Another cause of the overcrowded and unsatisfactory condition of the profession is, no doubt, the misapplied system of technical education. Our educational bodies, by "teaching all things to all men" without discrimination or regard to the profession or trade the student is engaged in, or proposes to be engaged in, are the cause of a mediocrity among our young men; the system launches into the different professions and trades totally unqualified men. The result is these are either engaged by firms requiring cheap labour, or they set up in practice on their own account, with no other qualification than that of a certificate obtained in an elementary examination.

If technical and trade classes were confined to those actually engaged, or to be engaged, in the particular professions or trades they would be of far greater benefit to the students and to the community than they can possibly be under the present system of open classes and consequent indiscriminate and useless education. No doubt this is also the cause of much of the unemployment at the present time, not only among sanitary engineers, but other professions and trades as well. The competent man has to give place to inexperience and cheap labour.

With a body of men with such wide interests, and engaged in such comprehensive work as that of sanitary engineering, there should be some clearly defined lines upon which they may work together, and some means should be devised whereby the public may be able to discriminate between the sanitary engineer who designs a sewerage scheme and he who fits up a water closet.

It is also important that this Institute should more clearly define its own position among the professions, and secure that its members be classified in some way so that the particular qualification of each in the profession may be indicated.

To meet these views it appears desirable that graded examinations should be instituted, which all who wish to practise as sanitary engineers should be required to pass, and, having passed, certificates should be issued to them which will indicate to all the particular branch, or branches, in which they have qualified themselves. And no man should be allowed to practise in any other than those shown thereon.

If this were done the examinations would become recognised by Governments, local authorities and others as qualifying for particular appointments.

There is another matter affecting the status of the profession, and in which there is room for improvement: this is in the sanitation of buildings.

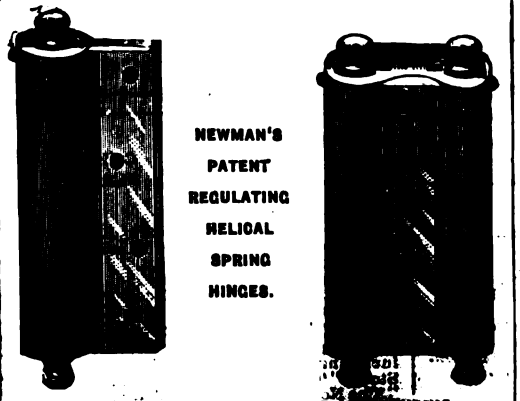
Much has been done in matters of both public and private sanitation, but much remains to be accomplished.

In public sanitation the sanitary engineer has carried out vast improvements, and if local authorities, in ordering these works, have created a large amount of public debt, the public themselves are as deeply indebted to the authorities for the increased health and lengthened life they enjoy as the result of the expenditure, while future generations will receive a double benefit therefrom in the greatly reduced mortality and the possession of works of lasting improvement.

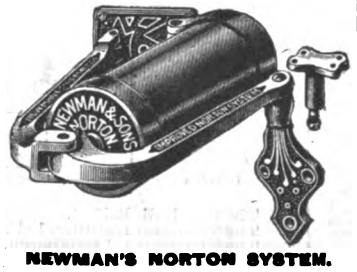
The early pioneers took as their motto, "Take care of the houses and the towns will take care of themselves." In the present day this is to a great extent reversed. Men will advocate and vote for the expenditure of thousands of pounds sterling on matters of public sanitation, but refuse to spend 50*l.* in putting their own property in order.

There is no question but there still exists a large amount of property (besides that of the working classes) which is in an insanitary condition; and if the same system of sanitary inspection was extended to it as is carried out in some districts under the Public Health Acts, many insanitary arrangements would be revealed which, if existing in a poorer neighbourhood, would be at once condemned.

In urban and rural districts, especially, houses are built with just sufficient sanitation to comply with the local bye-laws. They are built for sale. To all outward appearance they conform to modern sanitary requirements, and to the uninitiated they appear to be desirable residences. On closer examination, however, the sanitation proves to be mostly outside show. Intending purchasers or tenants are told the builder is also a sanitary engineer, and that the drains, &c., have been passed by the local authority.



The unsatisfactory state of these in different districts frequently proves a great hindrance to the professional sanitary engineer in his work. He finds it very difficult to persuade his clients that anything beyond what is required by the bye-laws is necessary for the proper sanitation of his house.



The public cannot realise that bye-laws represent the least amount of sanitation the law allows in the particular district to which they apply, and that it must necessarily be so from the fact that they have to apply alike to cottage and to mansion. Under these circumstances the engineer is debarred from making many desirable improvements, and unfortunately he is not assisted in many cases, by the local officials; on the contrary, they regard him as an intruder into their own preserves. Increased powers are therefore necessary under the Public Health Acts since the present bye-laws are insufficient to prevent bad work.

It is true the effect of stringent bye-laws is frequently to relieve many of that personal responsibility which it is only just that they should bear, but experience proves that there is no other way, in many cases, in which proper sanitary conditions can be obtained.

A systematic and periodical survey of every building could then be instituted, and if the premises were found in a proper sanitary condition and complying with the bye-laws, the cost of such survey should be paid for out of the public funds. If not, those responsible should be compelled not only to do what is necessary, but also to pay all charges incidental thereto, and, in addition, be mulcted in a fine in proportion to the rateable value of the premises. Such a measure would only affect the defaulters, while those who kept their premises in order would have the advantage of free surveys. Up to the present sanitary engineers have not taken the active part they should have done in public health legislation (not collectively at least). It is quite time that such an important body of men did so.

THE DUNDEE ADVERTISER
Is the Leading Daily Paper North of the Forth, and the Leading Commercial Paper in Scotland, out of Glasgow.
PRICE ONE PENNY.

THE PEOPLE'S JOURNAL.
SCOTLAND'S NATIONAL NEWSPAPER.
It enters more homes in Scotland than any other Newspaper. Weekly: One Penny.

Publishers:—JOHN LENG & CO., LTD., DUNDEE, and 186 Fleet Street, LONDON.

READING MERCURY and BERKS COUNTY PAPER.
GENERAL ADVERTISER FOR BERKS, BUCKS, HANTS, OXON AND WILTS. Saturday, 2d.
Established 1723. Enlarged January 1897.

READING MERCURY and BERKS COUNTY PAPER.
Circulates in Reading, Newbury, Hungerford, Wantage, Wallingford, Abingdon, Oxford, Faringdon, Marlow, Maidenhead, Blackwater, Bracknell, Henley, Wokingham, Kingsclere, Thatcham, Camberley, Ascot, Windsor, Slough, Mortimer, Pangbourne, Sandhurst, Swindon, Basingstoke, Wycombe, Staines, &c,

READING MERCURY and BERKS COUNTY PAPER.
Advocates the interests of agriculture and commerce and all measures for the social, moral, and intellectual improvement of all classes. Relied upon by all parties for the accuracy and impartiality of its reports of public and political proceedings, and for its complete local and general information.

READING MERCURY and BERKS COUNTY PAPER.
Offers unusual advantages as an Advertising Medium, since from its vastly increased and wide circulation, and its influential position among the English Newspapers, Advertisements are brought under the notice of *thousands of readers each week.*
All communications should be addressed to
THE PUBLISHERS, "MERCURY" OFFICE, READING.

SOUTH WALES DAILY NEWS.—Pre-eminent as an advertising medium, affording exceptionally wide and effective publicity throughout Wales and the West of England, particularly amongst the commercial and moneyed classes. No appeal for capital in the above-named district can be successful without recourse being had to the *South Wales Daily News*, which each day has a special article on "South Wales Finance."—Chief Offices: Cardiff. London: 46 Fleet Street, E.C.

Avoid uncertainty and worry by insisting on your Concrete being reinforced with
The PERFECTOR TRUSSED BAR
the only Bar which has the correct number of Shear Members irremovably attached.

The Bar is so firmly anchored at so many points that it is impossible to stress the Steel sufficiently to destroy the adhesion of the Concrete, consequently all the ideal advantages of Reinforced Concrete are preserved.
The only system which is proof against the carelessness of workmen.

Melbourne, Sydney, Brisbane, and Perth, Australia; Wellington, Christchurch, and Auckland, New Zealand; Launceston and Hobart, Tasmania.

SOUTH AFRICA—*Central News Agency, Ltd.*

Telephone No. 4725 Holborn.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

COMPETITIONS OPEN.

BURSLEM.—July 17.—For new public buildings. The author of the design placed first by the assessor will carry out the work. The architects placed second and third will receive premiums of 100*l.* and 50*l.* respectively. Deposit 2*l.* 2*s.* Mr. F. Bettany, borough surveyor, Burslem.

GLASGOW.—July 31.—The patrons of the Royal Incorporation of Hutchesons' Hospital invite designs for laying out for feuing and building about 195 acres of their lands of Thornliebank, Eastwood. Premiums of 100*l.*, 75*l.*, 50*l.* and 25*l.* will be awarded. Deposit 3*l.* 3*s.* Messrs. Hill & Hoggan, 194 Ingram Street, Glasgow.

GRIMSBY.—July 30.—For the extension of the town hall, at an estimated cost of 26,000*l.* Premiums of 250*l.*, 150*l.* and 100*l.* will be awarded. An eminent architect will act as assessor in conjunction with the borough engineer. Deposit 2*l.* Apply to Mr. H. Gilbert Whyatt, A.M.I.C.E., borough engineer, Town Hall, Grimsby.

IRELAND.—June 7.—The Athy Urban District Council offer a prize of 5*l.* 5*s.* for the best plans of three kinds of artisans' houses, to cost 100*l.*, 150*l.* and 200*l.* each. The successful competitor will be offered the carrying out of the scheme at 2½ per cent. on the total cost. Mr. J. A. Lawler, clerk, Town Hall, Athy.

READING.—June 15.—The Berkshire County Council invite designs for offices, committee rooms, &c., on the Forbury, Reading. Mr. Mervyn Macartney, F.R.I.B.A., assessor. Premiums of 100*l.*, 75*l.*, and 50*l.* Deposit 1*l.* 1*s.* Apply to Mr. J. Fred Hawkins, county surveyor, Bank Chambers, Cross Street, Reading.

BRABY & CO.

TRADE NOTES.

UNDER the direction of Messrs. J. M. Porter & Hunter, architects, Colwyn Bay, the "Boyle" system of natural ventilation, embracing the latest patent "air pump" ventilators, has been applied to Penrhos College, Carnarvon.

MESSRS. HATTERSLEY & DAVIDSON, LTD., Sheffield, are the patentees and sole manufacturers of the elliptical trussed ladder, which combines lightness with perfect rigidity. In the extension ladders the extension piece slides in a built up groove (between rollers of gun metal) and can be adjusted at 10-inch intervals. The staves or rungs are all 10 inches apart, except when otherwise ordered, each alternate stave being strengthened by a steel cross bolt. There are no springs, catches, &c., to work loose. The sides are made of Oregon pine, the rungs of English oak. Messrs. Hattersley & Davidson will show these and many other kinds of ladders at Stand No. 41 at the Royal Agricultural Show in Gloucester from June 22 to 26.

THE Flintshire County Council has entered into an important scheme for the provision of extended training college accommodation in North Wales. Four counties are concerned—Flint, Anglesey, Carnarvon and Denbigh. The scheme comprises the extension of the Bangor Normal College at a cost of 32,376*l*.

VARIETIES.

MR. HENRY DARE BRYAN, F.R.I.B.A., died last week at his Bristol residence at the age of forty-one. He was articled in 1883, and commenced an independent practice in Bristol seven years later.

MR. J. A. CARTER, who has been engaged in the local surveyor's office for the past nine years, has been appointed assistant borough surveyor for Workington at a salary of 120*l*. a year. There were over 100 applicants.

THE contract for the steel to be used in the construction of the naval base works and buildings for the Admiralty at Rosyth has been secured by the Brandon Bridge Building Company, of Motherwell, Lanarkshire.

MR. SYDNEY K. GREENSLADE, A.R.I.B.A., Gray's Inn Square, W.C., has been successful in the competition for the new buildings for the National Library of Wales. Their cost is estimated at 85,000*l*. The assessor was Professor Reginald Blomfield, A.R.A.

THE deadlock between the Lancashire County Council and the Local Government Board has been removed by the settlement of legal difficulties extending over eighteen months, and the Bacup and Rawtenstall Corporations can now go forward with the building of a technical school and institute at Waterfoot at a cost of 24,000*l*. The institute will serve a population of 60,000.

AT the last meeting of the Tynemouth Rural District Council plans were passed for the laying out of an estate at Benton Square, upon which the owners intend to build about 300 houses. The estate is near the new "Halt," at present being erected by the North-Eastern Railway Company, between Benton and Backworth Stations. Work has been commenced, several houses having already been built. Messrs. Armstrong & Wright, F.F.R.I.B.A., of Newcastle, are the architects.

SOME time ago the Aberdeen Harbour Commissioners, on the recommendation of the harbour engineer, sanctioned an important scheme of additional dock accommodation, and at the same time it was resolved to construct the new wharves of reinforced concrete. Arrangements have been made to employ a number of unemployed men through the Edinburgh local distress committee. The new wharves will take about

three years to construct, and the scheme, including dredging and other work, is estimated to cost about 85,000*l.*

THE Earl of Powis presided at a county meeting in Shrewsbury on Friday to further a scheme for reopening the old Shropshire and Montgomery Railway as a light railway. The line, which is eighteen miles long, links up Shrewsbury with the Cambrian system at Llangmynech, and has lain derelict for twenty years. About two millions was spent on it, and the new company has acquired the concern for 32,000*l.* About 20,000*l.* is required to reconstruct bridges that have tumbled down, rebuild stations that are overgrown with trees, and replace signal posts and fences that have been carried away and burned.

B. T. BATSFORD is about to publish in book form at 5*s.* net the lectures on "The Arts connected with Building," which were recently delivered at the request of the Carpenters' Company by leading architects and art workers. The book will be profusely illustrated with examples, both old and modern, of architecture, furniture, plaster, wood, lead, and ironwork. The lectures were delivered with a desire to see a revival of the best traditions of craftsmanship. The book is published at a small price so that it may reach craftsmen and the general public, whose interest and encouragement craftsmen require.

COWDENBEATH Town Council have accepted the offer of Dunfermline district committee for a supply of water from their new reservoir. The price asked is 6*d.* per 1,000 gallons up to 15,000,000 gallons, 5*d.* per 1,000 for the next 10,000,000, and 4*d.* for all above 25,000,000. The water question has been troubling the Council for a number of years, and at a meeting of the Council the scheme for raising their present reservoir at Roscobie was also discussed, but it was agreed to accept the district committee's offer.

A LOCAL GOVERNMENT BOARD inquiry was held at Yeovil last week, consequent upon an application of the Town Council to borrow 27,500*l.* for sewerage and sewage disposal. New works have been rendered necessary owing to the failure of the septic tank system, which cost between 30,000*l.* and 40,000*l.* The money is to be spent on the adaptation of the existing works with improvements and extension, the erection of a refuse destructor, and the remodelling of a large area of sewerage for the purpose of separating the surface water and the sewage. The evidence showed that the peculiar nature of the trade sewage caused difficulty, there being large quantities of hair and wool from the glove factories.

EDINBURGH Dean of Guild Court last week granted to His Majesty's Office of Works a warrant for alterations on the Royal Institution, Mound. The proposed alterations include the removal of the roof, the clearing out of the whole of the interior structure of the building within the four walls, the reconstruction of the interior, the provision of accommodation for the Royal Scottish Academy offices, and public cloak-rooms on the ground floor, and the erection of public exhibition picture galleries and sculpture hall on the new first floor. The walls are to be of brick finished in plaster, and those of the first floor of steel and concrete, lined with wood for hanging the pictures. All the floors will be fire-resisting, constructed of steel and concrete and finished with wood blocks, tiles, or marble. The new roof will also be of steel and concrete, and finished on the outside with asphalt. The drainage system will be reconstructed.

THE Building By-laws Reform Association held their sixth annual meeting last week at the Whitehall Rooms, Sir William Chance in the chair. The annual report was adopted on the motion of the Chairman, seconded by Mr. Mark H. Judge. In an appendix to the report a conference with the Rural District Councils' Association was reported, the outcome of which was the drafting of a Bill for amending the Public Health Acts for the purpose of giving relief under oppressive administration by means of by-laws. The draft Bill was submitted and approved. The Dowager Lady Lovelace, Mr. Lacey W. Ridge, Mr. C. F. A. Voysey, and

Scagliola Marble

An old Italian process, revived in the early part of the Sixteenth Century by Guido Sassi; is not a surface decoration, but a thoroughly artistic material. It was largely used by the Florentines in some of their most elaborate works, and was introduced into this country by Mr. J. Wyatt about 1750. It has been manufactured by this firm for the last 85 years, and fixed in many of the most important buildings in the Kingdom.

BY SPECIAL APPOINTMENT

Mr. R. A. Read, hon. sec., were elected to represent the Association at the adjourned meeting of the conference on the taxation of land values.

THE President (Chief Officer Meier, Amsterdam Fire Brigade), Vice-Presidents (Chief Officer Westphalen, Hamburg, and Mr. Edwin O. Sachs, London), and the members of the Executive of the International Fire Service Council concluded their annual business meetings in London last Friday. They have decided to prepare and issue a small technical pocket dictionary of fire-service terms in English, French and German, and to also publish in these three languages the results of a large number of the tests undertaken in London by the British Fire Prevention Committee, whose testing-station they had an opportunity of visiting during their stay in London. The Council now represents some thirteen countries, having together over two and a half million firemen.

A CONVOCATION was held at Oxford on Tuesday, when it was resolved to enlarge the Bodleian Library by the construction of an underground chamber. The Curators of the Bodleian made investigations, and satisfied themselves that the scheme of an underground chamber in close proximity to the Radcliffe Camera was practicable and safe, and that it would meet the requirements of the library for many years. One of the members appealed for delay and for the consideration of an alternative plan of a book store some miles out of Oxford. On a division the decree was passed by 119 votes to twenty-eight. The cost of the extension will be borne by the Trustees of the Oxford University Endowment Fund.

THE Board of Visitors of the Oxford University Observatory mention in their annual report that "the observatory has recently become exposed to a very sensible vibration during the day, which is apparently due to a new engine set up by the Clarendon Press. When a nadir observation is attempted with the transit-circle while the engine is running the image of the wires oscillates through several seconds of arc, in a period corresponding with the number of revolutions of the engine. The oscillation ceases when the engine stops running." As such observations are taken at the University Observatory only for educational purposes, no serious harm is done, but the visitors remark that the fact "is chiefly interesting from the sidelight it throws on the disturbance of Greenwich Observatory (where such work is of primary importance) by the electric generating station, placed about the same distance from the Royal Observatory as is the Clarendon Press from us."

DR. BROUGHTON, the medical officer for Heckmondwike, in the course of his annual report, says:—Action of lead on water supplied has been under serious consideration by you and the Dewsbury Water Board, and it is to be hoped that some definite and sure plan will be adopted, so that the water, when delivered to the householder, shall be free from lead. During the year six samples of water were sent to the county analyst, and the following is a report of the analysis:—Old property, ½-inch bore lead pipe, ½ grain of lead was found; new property, ½-inch bore lead pipe, ⅛-grain per gallon was found; ½-inch bore block tin-lined iron pipe (health pipe) laid in 1895, no trace of lead; from the same sources as first and second samples after the tap had run at full for three minutes, $\frac{1}{20}$ grain of lead per gallon found. The first four samples were taken after the water had stood in the pipes not less than ten hours.

THE Port-Glasgow Town Council have taken an important preliminary step in connection with the Bay Area improvement scheme. Some time ago the late Mr. W. T. Lithgow gifted to the Town Council of Port-Glasgow the sum of 10,000*l.* for the purchase of condemned properties in that part of the town. At the same time he offered to purchase the vacant ground. In this area it is estimated that there is a population of over 1,800. According to the plans prepared, it is proposed that forty-five tenements of houses be erected. The principal streets will be 60 feet wide, while the other streets will have a width of 50 feet. Schedules for the building of the houses were issued recently. The contract for the digger, mason, brick and slater work, and also for the joiner work has been secured by Messrs. P. M'Bride & Co., builders and contractors, Port-Glasgow, and it is believed that the value of this part of the work will not fall far short of 60,000*l.* It is expected that a start will be made by the contractors with the demolition of the old buildings in the course of a few days. The work is to be carried on in three sections, and one year is to be devoted to the reconstruction of each section.

WARING'S

(WARING & GILLOW, LTD.)

Beg to intimate that they are prepared under the personal direction of Architects, to

BUILD, ALTER OR ENLARGE

Hotels, Public Buildings, & Town & Country Houses of any size.

The feature of their Constructional Work is Soundness and Stability, combined with Rapidity of Execution.

In Waring's vast New Building, recently opened, there are Departments for everything in connection with either Contract or Private Work, and Architects may be assured that their wishes will be faithfully and carefully carried out by efficient workmen under expert supervision.

Waring's manufacturing resources enable them to satisfy Architects' requirements at the lowest tender prices.

THE ILLUMINATING ENGINEERING SOCIETY.

AT an inaugural dinner held on February 9, it was decided to form an Illuminating Engineering Society, having for its object the study of the science and art of illumination in this country. An executive committee was appointed to consider the drafting of the constitution of the Society, &c., and this committee reported at a meeting of the supporters of the Society, held at St. Bride's Foundation Institute, E.C., on May 25, Mr. Chas. Hastings being in the chair. The constitution and by-laws drafted by the committee were formally ratified and the executive committee, forming the nucleus of the first Council of the Society, were reappointed with the power of adding to their numbers as might be expedient, in order that they might proceed with the affairs of the Society during the summer vacation.

It was decided that this committee should approach a number of gentlemen, the names of whom were submitted to and approved by the meeting, with a view to their being invited to act as officers or on the Council of the Society. It was also agreed that the Council should be free to elect as members any who intimated their desire to become members of the Society, and were duly proposed and seconded in the prescribed manner, without the formality of ballot, up to the beginning of the first session of the Society.

Anyone interested in the objects of the Society, and desiring to become a member is invited to communicate with the hon. secretary, Mr. L. Gaster, Editor of *The Illuminating Engineer*, 32 Victoria Street, London, S.W.

THE award of the Board of Trade arbitrators in the Southport painters' dispute was received on Friday, and is against the men, who asked for an advance from 8½*d.* to 9*d.* per hour.

THE Welshpool Town Council have adopted a scheme submitted by Mr. S. R. Lowcock, engineer, London, for disposal of the town sewage and refuse at Henfaes estate. Last year the Council decided to purchase the Henfaes estate, conditionally, for the purposes of a sewage scheme at the price of 2,850*l.* Mr. Lowcock estimates the cost of the works at 3,878*l.*, making a total of 6,728*l.*

PROPOSED LAND TAXATION.

AN important memorandum has been issued by the Council of the Surveyors' Institution on the Budget proposals for the taxation of land. The following is a slightly condensed report:—

The Council of the Surveyors' Institution, being in touch with the views of the profession in all parts of Great Britain, and having themselves large experience in connection with the management and disposal of all descriptions of real estate, are perhaps peculiarly competent to form a sound opinion as to the probable effect of the Budget proposals for the taxation of land values.

They feel therefore that they need offer no explanation or excuse for their action in drawing up the following statement of their views.

They are, of course, aware that a necessity has arisen for raising money by increased taxation to meet national requirements, and that such increased taxation must inevitably involve a certain amount of hardship upon taxpayers. But their practical experience in the management and sale of houses and land leads them to fear that some misapprehension exists as to the consequences to be anticipated from the proposals for the further taxation of real property. Not only would serious loss be inflicted upon persons, including mortgagees, whose capital is invested in land or houses, but so great an obstacle to the cheap and rapid housing of the population would be interposed that the national loss would exceed any benefit which could accrue therefrom.

There have no doubt been cases of hardship to holders of building and other leases owing to the demands of grasping or unreasonable landlords, but the evidence taken by the Select Committee on Town Holdings in 1886, and by subsequent Parliamentary committees appointed to consider similar subjects, has established the fact beyond a doubt that the practice of building on the leasehold system has worked fairly to builders and the subsequent holders of the building leases, and has been of great assistance in the cheap housing of the population. It has enabled builders to provide houses without sinking their capital or running into debt for the purchase of sites, and has allowed ground landlords to effect important improvements without the assistance of public

SAVE 50%
OF YOUR
COAL BILL
BY USING THE PATENT
"SINE QUA NON" KITCHEN RANGE.
RECENT TESTIMONIAL.
Brentwood, January 19, 1909.
DEAR SIRS,—The "Villa Pattern Sine Qua Non" Range you made for us is a great success. It cooks perfectly, and we get any quantity of hot water for bath, lavatory, and sink, and the consumption of coal is very small indeed.
The rising bottom is easily manipulated, and as it lifts the fire bodily it converts it into a grilling stove, and, in my opinion, this is very much superior to the rising fire which hinges at the back. The use of the slow combustion arrangement not only saves a large amount of coal, but is a great comfort to the cook in protecting her from the heat of the fire and in keeping the kitchen cool. (*Signed*) J. T. GREEN.

money by clearing away insanitary dwellings covering considerable areas and substituting decent dwelling-houses.

It was also proved that the terms on which building leases were usually granted threw upon the ground landlord the burden of all outgoings to be foreseen at the time of the granting of a lease, and made ample allowance for the reversion to him at the end of the term of the buildings erected under the lease. The whole of any appreciation in value occurring during the term of the lease was shown to be appropriated by the lessee and his successors, an increase usually largely in excess of the additions to the burdens on the property which the lessees have to bear. There is therefore nothing inherently unfair in the arrangement between lessors and lessees which would justify special taxation to the disadvantage of the former.

Moreover, the conditions of the market for urban land and houses have changed much in recent years, and the Council fear this change would aggravate the harm which the proposed special taxation of this class of property would do.

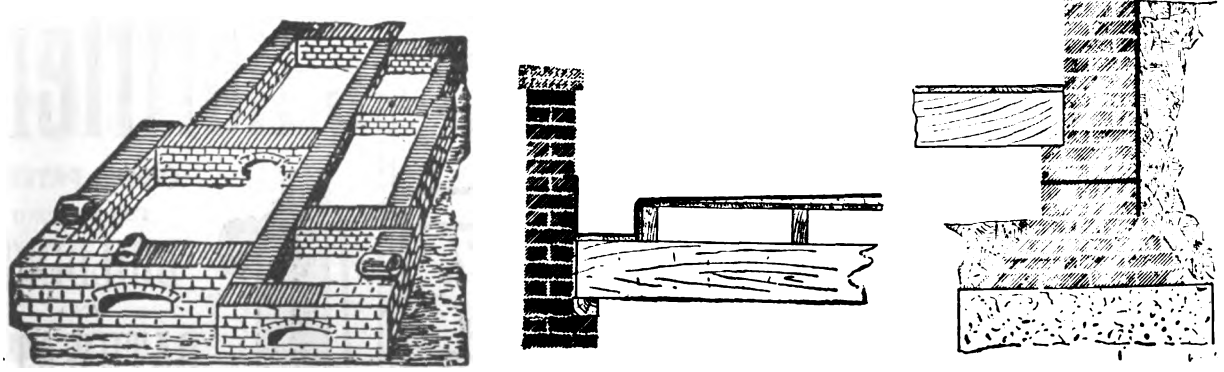
The use of telephones and improved means of road communication, such as motor traction and electric trams, have rendered it possible not only for persons of all classes to live outside the towns in which they work, but for the workshops and other premises in which trades are carried on to be in the country with the dwelling-houses of the workpeople employed around them; while merely the clerical work is carried on in offices in the town.

The result is that every year an increasing number of persons avail themselves of these facilities, and both live and work outside London and other large cities. The consequent relaxation of the pressure of population on urban space has already produced a marked effect on the value of property; for instance, the depreciation from this cause in Newington Causeway, Hoxton, parts of Notting Hill, and in many other districts and in most provincial towns, has been sufficient to cause serious loss to owners and mortgagees. To this the proposed additional taxation would without doubt add considerably, while it could not be justified on the ground of any necessity for forcing land or buildings into the market.

It is generally admitted that it is desirable that persons who are likely to be able to reside in the same neighbourhood for a considerable time should be encouraged to become owners of the houses they occupy, not only from the independence which ownership gives them and the advantage of their benefiting by any improvements they make, but because such ownership has a direct influence in giving men an interest in the good government and prosperity of the places in which they live and encouraging public spirit and thrift. To place special taxation on land and houses to the disadvantage of that form of investment compared with others would directly discourage purchasers of all classes, besides diminishing the number of houses provided for them to purchase.

The Council desire to limit their remarks to the three proposals upon which the practical experience of surveyors specially fits them to speak. They have therefore, in the short time at their disposal, without going into very great detail, prepared a statement showing to some extent what in their opinion would be the effect of the three duties on land proposed in the Budget, viz.:—

(1) The tax on increment value;
(2) The tax on reversions; and
(3) The tax on uncovered building land and ungotten minerals.



(1) While there is no doubt that there have been instances of extraordinary profit accruing to landowners through circumstances which have suddenly created a demand for their land for building purposes, such cases are exceptions.

In ordinary cases the growth of the value of building land is slow, and during the period between its having only agricultural or accommodation value and its attainment of its full value as sites for houses it will usually be found that land in the neighbourhood of towns has changed hands several times, and that the increment of value has been divided between several successive owners, all of whom except the last will have escaped the proposed taxation. In many cases this increment has been due mainly to the enterprise, judgment, and expenditure of the owners of the land, who have at their own expense made roads and sewers for the creation of building frontages, and in many cases have laid out gardens or executed other useful works for the purpose of attracting residents to their estates. The business of so dealing with land and providing building sites where required forms a large and important part of the transactions

SHEET LEAD as an effective and for **"ALL TIME" Damp Course** cannot be surpassed.

of many companies whose shares are a favoured investment of the middle and working classes.

In London alone a short time ago there were about fifty-three such companies, and there are some in most important provincial towns. One of these companies alone in thirty-seven years sold in building plots about 8,000 acres of land of the value of about 4,000,000*l.*

With a rapidly increasing population such as that of this country, it is manifest that it would be impossible to provide a supply of houses always ready to meet the increasing demand, and therefore always ahead of it, without a regular market for real property being maintained; and it is equally obvious that no persons would be induced to run the very serious risk involved, not only in building but in providing the sites on speculation, without reasonable hope of an adequate profit. If every profit made on dealings in houses and land were to be heavily taxed, business men would avoid such transactions and the market would be extinguished.

It is a matter of common knowledge that business of this class is subject to periodical ebb and flow, that for a time it prospers, and the selling of building plots and of speculative builders' houses produces considerable profits until the demand is over-supplied, and that a period of stagnation then inevitably follows during which building sites and unoccupied houses to the value of many hundreds of thousands of pounds lie idle, not only producing no interest, but involving their owners in the expense of maintenance.

To illustrate the effect of this ebb and flow of value it might well happen that an estate purchased for 100,000*l.* might be worth only 80,000*l.* at the date of valuation. A few years later, on changing hands through death or sale, its value might be found to have increased to 90,000*l.*, a loss of 10,000*l.* upon the original cost, but equally an increase of 10,000*l.* upon the later valuation, and upon this difference the State would take toll to the amount of 2,000*l.*, making the total loss 12,000*l.*

At the present moment, for instance, in Croydon alone there are about 3,000 empty houses, the population being about 160,000; and there are about 2,000 acres of uncovered land in the borough. A considerable portion of this is already laid out for building, and cannot be sold because there is no demand for houses to be built upon it; and the majority of the suburbs of London and provincial towns are in a similar condition.

It appears, therefore, that although an adequate supply of dwellings and their sites is at present maintained by persons willing to run considerable risk of loss, all business of the kind would be checked at once if any profit from their transactions were liable to taxation, while losses had to be borne without assistance.

Eastbourne has reached its present dimensions and popularity principally through the enterprise and expenditure of two great landowners, who have practically laid out nearly the whole of the town outside the original village at their own expense, spending many hundreds of thousands of pounds in making roads, sewers, gardens, &c., while the local authorities have provided for the requirements of the town out of the rates obtained from the persons who have been attracted to come and live on these two estates.

In such instances the increment of value to which the landowner is entitled cannot be limited merely to the interest on his actual expenditure, but must be allowed to include a proper reward for his risk and enterprise, for without such inducement development would not be begun.

It is a grave objection to the proposed duty that heavy taxation, which in most favourable circumstances would hinder considerably the free purchase and sale of land and houses, would necessarily be based not on facts but on mere opinion.

The circumstances of many urban properties are such that they are of much more value for other purposes than for those to which it is possible to apply them at the moment, and a correct valuation must depend on an accurate opinion as to the probabilities of the future, the circumstances of the surrounding district and other facts about which there is room for considerable difference of opinion. The same remark applies to each succeeding valuation. It might very easily happen therefore that a tax would be levied upon a supposed increment of value which subsequent dealings might prove to be entirely imaginary, and in that case justice would demand that the tax paid should be refunded. Besides it could hardly be proposed that the owners of land should be made liable to taxation based entirely upon ex parte valuations without a right of appeal; and the ex-

pense to both owners and the Government of the valuations and of the appeals would together be enormous.

A point which appears to have been overlooked is the difficulty which will arise in comparing past and present values as occasion arises and in thus arriving at the corpus for taxation. In many cases land after it had first been valued would be divided and again subdivided, and the difficulty of comparison would increase on each occasion.

The council therefore are strongly of opinion that the term unearned increment is in many cases a misnomer, and that the proposal to tax all increase in the value of real property would prove not only impracticable but a national injury, because it would impose an effectual check upon the development of land in the future.

2. As regards the proposed tax on reversions. There are, of course, some large estates on which ground rents secured by building leases for eighty years and upwards are still in the hands of the estates of the freeholders who granted them, but in the large majority of cases ground rents, which have been created many years, have changed hands many times since the original granting of the leases, and on each occasion the value of the reversion, increasing as it approached more nearly to its enjoyment, was carefully assessed and its value paid for in the price.

For instance, the purchaser of a freehold ground rent of 16*l*. per annum, secured upon a thirty years' unexpired lease of premises worth a rack rent of 100*l*. per annum, would, if he bought on the usual tables, give 739*l*., of which 276*l*. would be for the ground rent and 463*l*. for the reversion; while if the lease had only ten years unexpired the price would be 1,357*l*., of which 129*l*. would be for the ground rent and 1,228*l*. for the reversion.

When, therefore, the reversion falls in the benefit accruing from it is in the nature of goods delivered, which have been paid for in advance with a discount off for cash, and is not in any sense a windfall or an unexpected benefit for which the recipient can afford to pay a special tax.

It would be impossible to get out a statement of the number and value of ground rents sold even in London and by auction alone, but it is worthy of note that during the years 1906, 1907, and 1908, which were not busy years, ground rents to the value of over 2,000,000*l*. sterling were sold at the Auction Mart in the City of London alone. This forms but a small proportion of the whole, as the creation of ground rents, especially on suburban building estates, has been very rapid for many years past, and many are disposed of privately and by auction elsewhere.

In those cases where freehold ground rents have remained in the possession of the estate of the same owner during the whole time of the building lease, it has been clearly proved by the evidence given before parliamentary committees, that the terms on which such leases were granted in practically all cases made fair allowance for the fact that at the end of the term the building to be erected would become the property of the lessor, who has therefore already allowed a consideration for the reversion, including all the outgoings borne by the lessee and the cost of the building.

It seems certain that the tax in question would have the effect of checking the present system of letting land on building leases with its attendant advantages, and that a large amount of floating capital, at present available for expenditure in bricks and mortar, would be locked up in the sites to the disadvantage of tenants, and especially of the poorer classes.

3. As regards the tax payable annually in respect of the capital value of uncovered building land and ungotten minerals.

The proposal to tax the capital value of undeveloped or uncovered building land would in the opinion of the council have an opposite effect to that anticipated by the Government. Instead of land being forced more freely into the market, the demand would be checked by the hesitation of those who up to now have undertaken the development of semi-urban areas, to risk loss through land lying idle with the weight of taxation added to that of the interest accruing upon the original value plus the cost of development.

But in any event it cannot be insisted upon too strongly that forcing building land into the market before there is any real demand for it is not only without benefit to the surrounding district, but is actually a source of injury by lowering the rateable value of houses, which are depreciated by the proximity of uncovered building plots. Nor will the fact of land being forced into the market secure building upon it until the demand justifies the expectation that persons can be found within a reasonable period to occupy the houses when built.

The existence in suburban and semi-suburban districts of large houses with grounds of several acres in extent is a great benefit to the inhabitants. Much labour is employed by the occupants both directly and indirectly in the upkeep of the premises, and the proximity of such houses and their grounds adds to the enjoyment of the neighbouring houses and to their rateable value.

If the quantity of land occupied with these residences were limited by taxation to one acre or any comparatively small area, the houses would become valueless for their present purpose, and it would be necessary to pull them down and endeavour to utilise the grounds as sites for smaller houses. But it is desirable to discourage and not to encourage this process, in the first place because it renders neighbourhoods less pleasant and less healthy, and in the second because the prospect of profitable development is already so strong an inducement to owners to cut up such properties that they are almost always laid out for building prematurely, to the great depreciation of the rateable value of the surrounding district.

It is not too much to say that there is hardly a suburb of London which has not suffered injury in this way, and this of course involves serious loss of rates to the local authorities.

Under present conditions the difference between the income produced by land let for building and that let for other purposes affords an inducement to owners of all classes to put their land into the market for building as soon as possible, with the result that the supply in most places exceeds the demand. But proposals which would add to the loss in the event of failure and detract from the profits of success, would limit such transactions to those whose means enabled them to run greater risks and to stand out of a return for their money for a longer period, while such persons would look necessarily for a wider margin of profit than would otherwise be the case. In the opinion of the Council, therefore, the effect would be twofold:—(1) Land would not be laid out for building while it was possible to contend that it had only accommodation value, with the result that there would be no supply of sites and buildings in advance of the demand; and (2) those who purchase it with a view to development would insist upon a greater profit in order to compensate them for their greater risk of loss.

It is obviously advantageous to the public to secure an ample supply of dwellings at low rents and prices; but, if in addition to standing out of their return upon the cost of the roads and sewers made to create building frontages and of interest on the capital sunk in the land, the owners of uncovered building land had to pay a tax on its capital value, the laying out of building land would be restricted and delayed in order to avoid such loss, with the result that the supply of houses would be limited and rents and prices raised in consequence.

It is obvious that the imposition of a tax on the capital value of property, at a time when it could not produce any return at all in proportion to its value, must lay a heavy burden upon its possessor, and especially on those land companies formed to provide sites for houses for the working classes. At the present time these companies in the neighbourhood of London alone own uncovered sites believed to be nearly 1,000,000*l.* in value, while they already pay small or no dividends.

With regard to ungotten minerals, the cases in which minerals which could be worked at a profit remain ungotten are rare, as in almost all cases owners are only too anxious to turn to account any minerals of value to be found upon their estates. There are, however, many estates under which it is known that coal exists, which owing either to its depth or the poorness of its quality, it is at present impossible to work at a profit. The time no doubt must come when increase of price or improvement in the methods of mining will render it profitable to work this coal, but meanwhile the minerals must necessarily lie idle. It would therefore be an obvious injustice to compel an owner, who cannot get anyone to work the minerals under his estate, to pay an annual tax on an unavailable capital value.

In the case, therefore, of both uncovered building land and ungotten minerals, the Council foresee many objections to the proposed tax which may not have presented themselves to the Government, and which would, in the opinion of the Council, more than counterbalance the income to the nation to be anticipated therefrom.

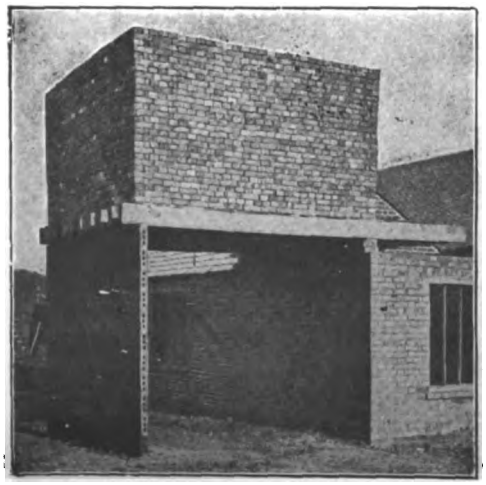
A practical objection to this tax presents itself in the difficulty of saying when any particular piece of land will become liable to its payment. A large proportion of the land in this country has a prospective building value, and therefore exceeds 50*l.* per annum in value, but presumably

Digitized by Google

it is not proposed to place the additional tax upon any particular plot until it is actually ripe for building. Otherwise a tax would be imposed which in many cases could not be met out of the income of the estate, but would have to be satisfied out of the corpus itself. Opinions must differ as to whether land has become ripe for building, with the result that expensive appeals will follow, and in any event the tax will be based upon mere opinion and not upon fact.

The effect upon mortgage securities through the depreciation in value caused by the proposed taxes and the fear of others on the same lines will be in many cases more than to destroy the margin of the value of the security, and will render it difficult, if not impossible, at any rate for a considerable time, for mortgages to be effected at all. Indeed, instances have already been brought to the notice of the Council where both mortgages and sales have fallen through on account of the proposed taxation, and this is not a matter which affects merely the well-to-do classes, as the 1907 returns show that the building societies, the members of which to the number of 60,000 are mostly people of comparatively small means, have more than 57,000,000*l.* invested in mortgages of land and houses. The consequent uncertainty of value will probably render mortgages improper securities for trustees and involve the calling in of many such investments.

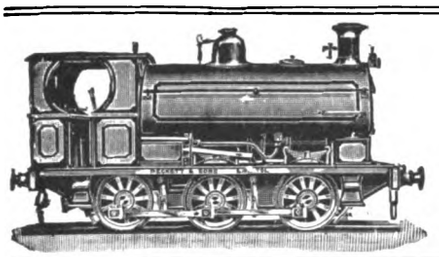
Insurance companies will also be adversely affected. They have also large sums secured by mortgage upon properties in which much uncovered land is included, and the proposed tax would have the effect of imposing a charge in front of that security which was not contemplated at the time the advances were made.



It is difficult to say what depreciatory effect on the value of real property would be caused were a purchaser in future liable to a tax of one-fifth on any profit he might make by a resale, having at the same time to face the risk of depreciation from many causes, among others the possibility of an extension of such similar taxation, but it is not too much to say that such a tax would practically destroy the general market for real property.

It is not unusual for ground rents in quite small parcels, say of 10*l.* a year, to be sold in separate lots. They are the favoured investment of thrifty people of small means, and the one attraction which overcomes the objection that the expense of the transaction is in most cases out of all proportion to the value of the purchase is the fact that not only is the income unfluctuating but continually growing in value as the lease runs out, thus serving as a provision for the future. If that advantage is impaired the value will fall to an extent which it is difficult to calculate, at any rate far out of proportion to the mere capitalised value of the proposed tax.

With regard to uncovered land, as almost any land under the present altered conditions of road communication might become capable of being used for building, it would in ordinary circumstances become almost unsaleable, because no purchaser would care to face the risk of having to pay an annual charge in the shape of taxation, besides standing out of the annual interest on the value while the land lay idle.



SIR GEORGE HAYTER CHUBB, writing to the *Times* from 128 Queen Victoria Street, E.C., on the effect of the Budget on the building trade, says:—"Mr. Lloyd George and many other people seem to be under the mistaken impression that the extra taxation proposed by the Budget will be felt only by those who are well-to-do. I have been told this week of a builder who had two or three estimates out awaiting decision; but when the Budget was introduced he was informed that none of the buildings would be proceeded with, so he gave notice to sixty of his men to leave to-day. At the present moment the Budget has hardly affected any rich men; but here is one case (out of, probably, very many more) where a number of working men and their families suffer at once. The proposed tax on increased values of property will have exactly the same general effect. I am a director of a company which has been negotiating with the ground landlord for a long building lease at an increased rent. One clause in the proposed agreement says that any land tax, old or new, is to be borne by the tenant; and, as we are advised that the extra cost to us, under the Budget proposals, may be 2,000*l.*, we are holding our hand and not going on with our scheme to distribute about 10,000*l.* among workmen in erecting a new building."

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

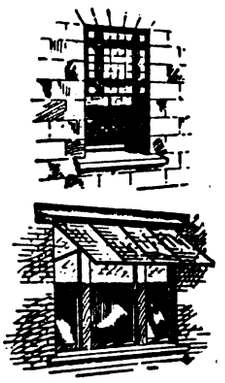
The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BURSLEM.—July 17.—For new public buildings. The author of the design placed first by the assessor will carry out the work. The architects placed second and third will receive premiums of 100*l.* and 50*l.* respectively. Deposit 2*l.* 2*s.* Mr. F. Bettany, borough surveyor, Burslem.



DEPTFORD.—Sept. 1.—The Metropolitan Borough Council of Deptford invite designs for a branch library at New Cross, S.E. Premiums of 50 guineas, 25 guineas and 10 guineas will be awarded. Assessor, Mr. J. S. Gibson, V.P.R.I.B.A. Deposit 1*l.* 1*s.* Competition is limited to architects practising in the city or county of London. Mr. Vivian Orchard, Town Clerk, Town Hall, New Cross Road, S.E.

GLASGOW.—July 31.—The patrons of the Royal Incorporation of Hutchesons' Hospital invite designs for laying out for feuing and building about 195 acres of their lands of Thornliebank, Eastwood. Premiums of 100*l.*, 75*l.*, 50*l.* and 25*l.* will be awarded. Deposit 3*l.* 3*s.* Messrs. Hill & Hoggan, 194 Ingram Street, Glasgow.

GRIMSBY.—July 30.—For the extension of the town hall, at an estimated cost of 26,000*l.* Premiums of 250*l.*, 150*l.* and 100*l.* will be awarded. An eminent architect will act as assessor in conjunction with the borough engineer. Deposit 2*l.* Apply to Mr. H. Gilbert Whyatt, A.M.I.C.E., borough engineer, Town Hall, Grimsby.

READING.—July 31.—The Berkshire County Council invite designs for offices, committee rooms, &c., on the Forbury, Reading. Mr. Mervyn Macartney, F.R.I.B.A.,

LUXFER SASH CANOPY SKYLIGHT PAVEMENT PRISMS

SAVE 50%
OF YOUR
COAL BILL
BY USING THE PATENT
"SINE QUA NON" KITCHEN RANGE.
RECENT TESTIMONIAL.
[Copy] 46 Newcastle St, London, E. June 8, 1909.
GENTLEMEN,—You will no doubt be pleased to hear that the "Sine Qua Non" Range we recently had from you is giving every satisfaction; we understand that the amount of coal consumed is practically one half of what the old range consumed.
We have, under the circumstances, strongly advised our client to have another "Sine Qua Non" fixed, and so save the other half.
We are, Gentlemen, yours faithfully,
(Signed for A. EATON & CO., LTD.,)
J. H. STONEHOUSE, Director.
This unsolicited testimonial, with many others, may be seen at, and Catalogues obtained on application to, the Sole Manufacturers,

WRENBURY.—June 26.—For interior alterations to Wrenbury Church, near Nantwich, comprising wood-block floor and reseating to nave and aisles, heating, ventilation, &c. Deposit 3*l.* 3*s.* Mr. C. Russell Hall, architect, Congleton.

YORK.—June 12.—For building conveniences at Mount Vale and Albemarle Road. Deposit 1*l.* 1*s.* Mr. F. W. Spurr, city engineer, Guildhall, York.

YORKS.—June 21.—The West Riding education committee invite whole or separate tenders for the following works:—Clayton Provided School—new heating boiler; Royston Provided School—alterations (builder, joiner, plumber, plasterer). Deposit 1*l.* each. The West Riding Architect, County Hall, Wakefield.

AT Glasgow Dean of Guild Court on the 27th ult., Mr. M. Pearce Campbell, Dean of Guild, presiding, authority was granted to the Glasgow and West of Scotland Technical College to erect the last portion of the new buildings whose frontage is to George Street. This part, which is estimated to cost about 40,000*l.*, is situated in John Street, and occupies the former site of St. Paul's parish church. The Western Infirmary were authorised to erect, at a cost of about 15,000*l.*, additional ward accommodation. A lining was granted to the Partick Thistle Football Club, Ltd., 995 Dumbarton Road, Whiteinch, to form a football field, erect a grand stand and corrugated sheet fence and pay-boxes in Firhill Road. The total cost will be about 2,100*l.*

AT a meeting of the Edinburgh, Leith and District Building Trades Association, held last week in the Building and Allied Trades Exchange, Edinburgh, the question of the prices for jobbing work, inserted by the surveyors in the schedules of the contracts for the erection of the offices of the United Free Church, were under consideration. It had been pointed out to the representatives of the United Free Church that in some cases the figures for material were actually lower than those quoted by the wholesale timber merchants in Leith. A request has been made that the agents of the United Free Church should receive a deputation from the Builders' Association on the subject.

TRADE NOTES.

MESSRS. PATMAN & FOTHERINGHAM, LTD., builders and contractors, 100 & 102 Theobald's Road, W.C., have obtained the contract for the erection of a large block of chambers at Brick Court, Middle Temple, E.C., for the Honourable Society of the Middle Temple. The joint architects are Sir Aston Webb, R.A., and Mr. H. J. Wadling.

HOFLER, LTD., 26A Soho Square, W., have secured the order for the council chamber furniture of the University of South Wales and Monmouthshire, Cardiff, to the designs and under the supervision of Mr. W. D. Caröe, architect. Messrs. Hofler's factory is at Young's Corner, Hammersmith, W.

THIEVES and fires are the two sworn enemies of John Tann, and it seems as if victory lies with him if we may judge from the letters of thanks which flow into his office in 11 Newgate Street, E.C. To instance two received in April last. The Secretary to one charitable institution wrote:—"Although burglars tried to break open the 'Anchor Reliance' safe we purchased from you, they did not succeed in doing so, as it resisted their efforts completely." The other came from a firm of piano manufacturers whose works were destroyed by fire on March 27. The letter says:—"The premises were packed with goods which were entirely destroyed, but happily our securities and valuable books, &c., were contained in one of your 'Anchor Reliance' safes which fell from the second floor and remained in the burning débris for two days until it cooled down. The safe had undergone such a remarkable test we were surprised at the contents being in such splendid condition; everything being as perfect as when placed in the safe before the fire. . . ." These may be given as typical of the general experience of purchasers of the safe. Mr. John Tann is, in addition, a specialist in strong-room construction. The ingenuity necessary to conduct such a business is applied to small things as well as big, as is seen in his new key ring, which is a powerful spring locked by a steel loop. To put on or take off a key it is no longer necessary to run the risk of injuring one's finger-nails.

PARISH OF BERMONDSEY.—THE INFIRMARY, LOWER ROAD, ROTHERHITHE—SITE PLAN.

THE Trussed Concrete Steel Company have issued a booklet which is confined to one single application of the Kahn system, viz. the Kahn Trussed Lintel—*i.e.* lintels of concrete reinforced with the Kahn trussed bar. It is put forward as a substitute for the usual rolled-steel joists or built-up girder, and one which will effect a saving of from 25 per cent. The list of standard types which can be promptly furnished commences with a span of 3 feet. In this two ½-inch bars are used; the minimum depth and width of the lintel is 7½ inches and 6 inches respectively, while the total safe load carried is 4,700 lb. The price for the complete reinforcement per lintel, including carriage to the nearest railway station, is 1*s.* 6*d.* For a span of 20 feet the two Kahn bars used are 1¾ inches; the width and depth of the lintel is 19 inches and 12 inches; the safe load is 30,600 lb., and the price is 2*l.* 1*s.* each. The span of the lintel may, however, be carried up to 40 feet if desired; in such large openings it is possible to build the reinforced concrete lintel within the wall, and, if necessary, extend it upward to 4 or 5 feet so as to make the wall into a beam. The pamphlet, which may be obtained on application, should be read by all architects who are about to carry out the construction of any large building.

VARIETIES.

THE Middlesex County Council are going to erect, at a cost of 65,475*l.*, an addition to Napsbury Asylum for 582 patients, although the asylum, accommodating nearly 1,500, was opened only four years ago.

MESSRS. HINE, ODGERS & MAY have prepared plans for alterations to the public school, Plymouth, at an estimated cost of 1,000*l.* The plans have been approved, and application is to be made to the L.G.B. for the necessary loan.

THE establishment of cottage baths in Coventry Street, Birmingham, has been so successful that the baths and parks committee of the City Council have decided to extend the system by providing similar baths in five other districts of the city.

MR. WILLIAM LIVERSIDGE, of Millgate House, Selby, has promised to defray the cost—about 200*l.*—of providing new furnishings for the altar in the new choir of Selby Abbey. He made himself responsible for the restoration of the east window when last the choir was renovated.

THE Stockport Town Council have authorised the waterworks committee to purchase 200 acres of land in the Sett Valley for the construction of a reservoir to increase the town's water supply, in addition to the one being constructed at Kinder.

A START was made last week with the preliminary work in connection with the erection of the large model lodging-house at Jamestown, which is to be built at a probable cost of 8,000*l.* The contract for the mason and brickwork, which is estimated at 2,500*l.*, has been secured by Messrs. M'Lauchlan, brickmakers and builders, Larbert.

THE Special Commission of the British Fire Prevention Committee left London for North Germany on Wednesday, to study various matters relating to fire, more particularly in respect to theatre safety, petrol storage, warehouses and shops. They will visit Berlin, Hamburg and other cities, and issue a report on their visit, as on previous occasions.

THE foundation-stones of the Congregational Church, Palmer's Green, N., were laid on June 5. The design is in late Gothic. Bath stone is being used for the dressings, pressed red bricks for the facings, and oak for the joinery. The contract is let to Messrs. Mattock Bros., of Winkfield

Road, Wood Green, N. The architects are Messrs. George Baines & Son, of 5 Clement's Inn, Strand, W.C.

MESSRS. BRUNNER, MOND & Co., chemical manufacturers, have commenced the erection of workmen's baths for their men at Winnington, Northwich. The building will cost 4,000*l.*, and will be 135 feet long. There will be fifty shower and six slipper baths and 100 dressing and drying rooms. Arrangements will be made to allow the employees to take baths after their day's work and to change from their working into their home clothes.

MESSRS. HASLAM & SON, auctioneers, Reading, recently announced that terms had been practically arranged for the erection of a factory at the rear of the plots of building land on the Ayres' Farm Estate, fronting the Basingstoke Road. The extent of the ground required for the factory will cover five or six acres, and employment may be found for 300 hands. The promoters, whose names could not then be given, desire to erect something on the lines of Bournville.

THE St. Annes District Council decided on Monday against a skating rink which it was proposed to put up in the town. Plans for a temporary building had been submitted by an entertainment provider, and the highways and building committee recommended the Council to pass them. On the casting vote of the chairman, the plans were referred back. Several of the members considered the existence of a rink would vulgarise the resort.

A BRITISH Timber Conference is to be held in the offices of the London Chamber of Commerce, Oxford Court, Cannon Street, E.C., on Wednesday next, under the joint auspices of the Royal English Arboricultural Society and the Timber Trade Federation of the United Kingdom. Its object is "to discuss questions of interest bearing upon the improvement and development commercially of the growing and utilisation of native timber in the British Isles." The president is Mr. E. Stafford Howard, C.B. (Commissioner of His Majesty's Woods, Forests and Land Revenues).

PLANS for the extension of Lenzie Academy have been passed by the Kirkintilloch Dean of Guild Court. They provide for the pulling down of the older portion of the school, leaving only the north wing standing. It is proposed to provide a laboratory, cookery-room and two secondary classrooms, together with ample lavatory and store accommodation, and to alter the existing rooms so as to give an art room and two higher grade classrooms. A workshop for manual instruction is also to be erected. The architect is Mr. Baird, Glasgow, and the estimated cost is close on 6,250*l.*

THE Home Secretary has approved of the acceptance by the Essex County Council of the scheme and tender of Messrs. Dargue, Griffiths & Co., Ltd., for the engineering plant at the Essex Second County Asylum, Mile End, Colchester, including boilers, pumps, warming, ventilating, hydrants, &c. The work will be carried out in sections, the first of which, amounting to 20,000*l.*, is now going on. The system adopted is the "D.G. Economic Centralised."

THE free libraries committee of the Sheffield City Council have inspected the Old Sheffield Music Hall premises in Surrey Street, proposed to be acquired for library purposes. The committee think that, having regard to the age and condition of the building, it is not advisable to undertake any large scheme of alterations. The committee believe that for 500*l.* the premises can be made clean and safe, and adapted for library purposes temporarily. The proposed price of the music-hall is 6,750*l.*

THE Concrete Institute will hold a general meeting (Mr. F. E. Wentworth Shields, M.I.C.E., in the chair) at the Royal United Service Institution, Whitehall, S.W., on Thursday next, for the adjourned discussion of the paper by Mr. H. K. C. Bamber, F.C.S., on "The Setting of Portland Cement and Methods of Regulating the same." When the paper was read on May 27 the following took part in the discussion:—Mr. Bertram Blount, F.I.C., Mr. D. M. Butler, A.M.I.C.E., Mr. R. Harry Stranger, Dr. Siegmund Rosenfeld, Mr. W. Lawrence Gadd, and Mr. C. S. Meik. Owing to the number of speakers it was unanimously decided to adjourn the meeting.

THE Inverness Harbour Trustees last week considered a report by Mr. R. Gordon Nicol, harbour engineer, Aberdeen, on the competitive plans and site for a steam drifter harbour. Mr. Nicol estimated that the cost of the complete scheme for 460 drifters would be 130,604*l.*, and for 230 boats the amount would be 78,544*l.* He considered the scheme of Mr. James Fraser, C.E., Inverness, was the most suitable for the port of Inverness. It was thereupon agreed that the Trustees ask

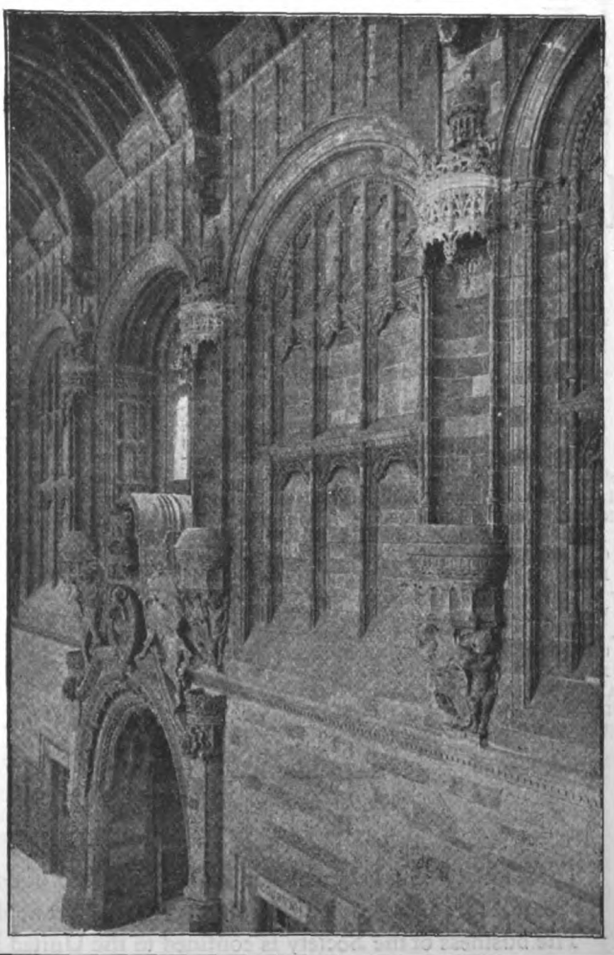
Mr. Fraser to prepare a new scheme at a cost of 20,000*l.* for the site suggested by Mr. Nicol.

SINCE the settlement of the Rosyth contracts, Inverkeithing, as the nearest community to the future naval base, has attracted a good deal of attention from prospective builders. A number of new properties are in course of erection, while several existing subjects are being altered. At the last meeting of Inverkeithing Town Council a petition for warrant to form a new street on what is known as the Roodsfield was again submitted from Messrs. Johnston, solicitors, Kirkcaldy, on behalf of the Rosyth Buildings and Estates Company, Ltd. It having been reported that the company had accepted all the Council's conditions, warrant was granted. The architect is Mr. Williamson, Kirkcaldy. Building operations are to begin without delay.

THE Association of Building Societies at their annual conference adopted the annual report, which contained the following:—"Where land is deliberately kept out of the market to the manifest injury of the community, power should, it is thought by many, be given to the local authority to acquire such property at a fair price, quite apart from any system of taxation of land values. Further, no tax is satisfactory which is not general in its incidence. This Association knows nothing of party, but is very certain that any well-meant but ill-considered legislation which discourages thrift will prove a disaster to the country the full consequences of which it is impossible to foresee."

DR. T. F. DEWAR, the medical officer of health for Fife, in his annual report refers to the housing of the working classes. Owing to the adoption of building by-laws, he states, in all the districts of Fifeshire, and to the care scrupulously taken that all new or radically altered houses conform thereto, an improvement in the conditions of housing is gradually taking place all over the county. One regrets to notice, however, that in the houses intended for the occupation of the humbler classes bed recesses are still very frequently provided, in clear antagonism to the view now everywhere accepted in theory, that light and air in liberal allowance are primary essentials for health. Examination of plans also shows that there is still a prevalent opinion that domestic servants require less cubic space and even less light and ventilation than those whose comfort their service secures. When in years to come, observes Dr. Dewar, houses with such features come under the scrutiny of our successors in administration it will assuredly be matter for surprise that these anomalies should have been countenanced.



AT the annual conference of the Institute of Cleansing Superintendents in Glasgow on Tuesday an interesting paper was read by Bailie James Henderson, convener of the committee on cleansing, on "The Evolution of Cleansing in Glasgow." He first referred at some length to the condition of matters which existed in the first half of the nineteenth century. As to the present utilisation and the revenue now obtained, apart from the revenue derived from the sale of manure, a new source of income had of recent years been tapped by the saving of clinker from the cremating process and of cast-out articles found in the refuse. As regards clinker, that material, which prior to 1897 was considered valueless, was trucked to the country at a cost of 1*s.* per ton. In that year an endeavour was made to introduce it to builders for concrete work, and a start was soon effected. The revenue that year was 242*l.*, and it had gone on increasing until last year the sum received from that source was 1,711*l.* 18*s.* 5*d.* for 13,307 tons sold. After referring to the revenue from old tins, from which, he said, the princely sum of 1,982*l.* was derived in 1908, he alluded to sales of waste paper. The system of lifting paper from business premises by means of bags when inaugurated in 1900 brought in 116*l.*; last year the revenue was 618*l.* Twelve years ago, when the utilisation of waste products was seriously tackled, the sum derived from their sale was 679*l.* In 1908 the income reached 4,757*l.*, while the aggregate for the twelve years was 33,028*l.* It would thus be seen that money could be coined from rubbish if it was properly handled. As to snowstorms, the removal of snow from the streets was the most trying ordeal which a superintendent had to undergo. Nowadays a snowfall required to be speedily dealt with in large cities. Any slackness on the part of the Cleansing Department would mean disorganisation of the street traffic, and consequently much inconvenience to the citizens. With the rivers Clyde and Kelvin as tipping places, together with various tips around the outskirts, the cartage was reduced to a minimum.

RAILWAY SERVANTS' ORPHANAGE.

IT is an unusual occurrence to be able to point to an orphanage as an object-lesson in the happy employment of colour for interior walls. But this may be safely done in the case of the London and South-Western Railway Servants' Orphanage at Woking, which is to be opened in July by His Majesty the King. The architect, Mr. W. E. Trevena, of South Farnborough, has very successfully adopted "Duresco" in its various colours for several of the larger apartments, commencing with the hall, which is in ivy-green and carmine. The dormitories are reposeful and soft, with the filling in cream Duresco, and the dado (which is specially pleasing) in the ivy-green. The large expanse of walls in the dining hall offered a fine field, and it demonstrates the beautiful velvety effect peculiar to Duresco. The work has been ably carried out by Mr. E. C. Hughes, of Wokingham, whose tender, amounting to about 20,000*l.*, was accepted for the entire building.

MESSRS. D. BALFOUR & SON, of Newcastle-upon-Tyne, have been appointed by the Doncaster Rural Council engineers to report and advise upon the best means for the sewerage and disposal of the sewage of the portion of Adwick-le-Street on the north side of the railway, and the parishes of Owston and Skellow.

THE late Mr. J. A. D. Shipley, solicitor, a former under-sheriff for Newcastle and Northumberland, left estate of the gross value of 188,000*l.* Testator bequeaths his pictures, numbering about 2,500, to Newcastle, provided that at the time of his death (which occurred on February 4), or within three years afterwards, there should be a gallery (other than the existing Corporation Art Gallery) in the city, free to the public, of sufficient extent to accommodate them, that the collection shall go to such gallery, and, should there be an art gallery capable of being extended so as to hold his pictures, he directs his trustees to raise 30,000*l.* towards the enlargement. Failing such provision in Newcastle, the pictures are to be successively offered, on like conditions, to Gateshead, the National Gallery, the Tate Galleries, the National Portrait Gallery, and the Kensington Museum.

DESTRUCTIVE FIRE AT HAMMERSMITH.

MOST of the evening papers of the 3rd inst. and the morning papers of Friday gave descriptive accounts of the great fire at Brunswick Works, Hammersmith, belonging to

Messrs. W. N. Froy & Co., builders' merchants. The extensive premises have a frontage (of which we give a photograph) on King Street—the main artery from Piccadilly,

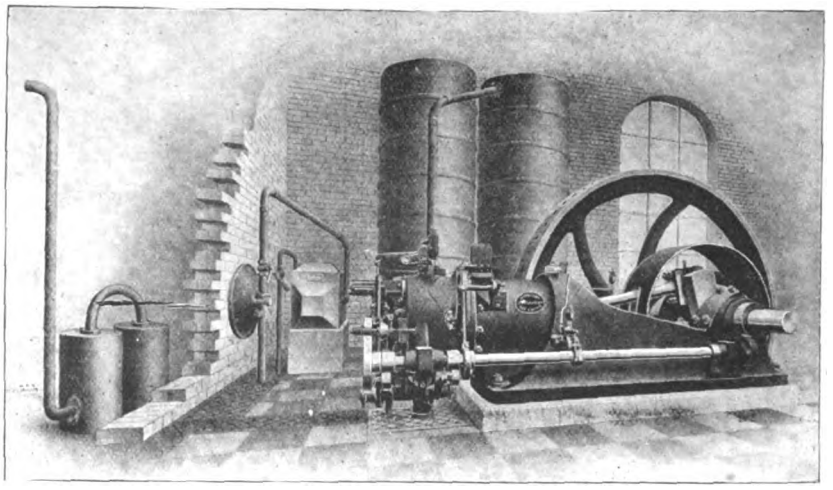
along Kensington, Hammersmith, Chiswick, Kew and Brentford to the West of England. The outbreak was discovered about 5 A.M. on Thursday morning by a passer-by, who noticed smoke issuing through the front entrance for the vans. He immediately rang the fire alarm and aroused the caretaker. The call was quickly responded to by a very large force of firemen, which got to work under the personal direction of Captain Hamilton and Mr. S. Gamble, who arrived from headquarters. Their work was carried out under considerable danger from the falling débris and the enormous heat. It was impossible to quench the flames which raged over the centre and main front of Messrs. W. N. Froy & Sons, Ltd., premises, a space of 250 feet by 80 feet, which contained a great deal of inflammable material such as oils, paints, colours, brushes, &c. Then the great paper show room caught fire, and about 400,000 or 500,000 rolls of wall paper became sheets of flame; so intense was the heat, heavy iron girders were twisted about like pieces of wire. It became necessary to stop all traffic along King Street, and to barricade the road and pathways.



Fortunately, owing to the direction of the wind and the efforts of the fire brigade, the second and third warehouses, which extend over a site as large again as the first, were untouched. After several hours' work the fire was got under, but not before all entrances and exits were blocked with heaps of fallen timber. Mr. H. P. Froy, the managing director, however, soon devised another entrance at the back through the large stables which gave access into King Street. The same energy and ingenuity overcame other obstacles, and undismayed by the severity of the outbreak the staff carried on their business practically as though nothing had happened, and the orders coming in by letter, telephone and telegram were executed with as little delay as possible. It was fortunate that the new show rooms, which have been greatly admired, remain intact. Messrs. W. N. Froy & Sons, Ltd., hope to immediately commence rebuilding the front and centre building. Indeed, with praiseworthy alertness the firm have already in view the erection of premises even more extensive than those which have become in course of years well known throughout the country.

THE HORNSBY-STOCKPORT GAS ENGINE AND SUCTION PLANT.

THE Stockport gas engine came on the market some thirty years ago as one of the pioneers in its class. The original company was afterwards amalgamated with Messrs. Richard Hornsby & Sons, Ltd. The engine was considerably altered and improved until it reached the high degree of excellence now common to all the Hornsby-Stockport gas engines. Our first illustration gives the general arrangement of the engine-room showing tanks, exhaust, &c., for plant working with town gas. Among the principal features of the gas engine we might mention:—

The cylinder is well supported, the cylinder jacket being cast with the frame; balanced cranks and a loose liner are on all engines; a splash guard is always provided over the cranks; a patent magneto-electric ignition, with adjustable timing is on the engines of 25 b.h.p. and above; all valves are open to inspection and easy of access; ring oiling is provided for main bearings, side-shaft bearings (except few small sizes), and for all outer bearings; there is continuous lubrication to crank-pin on all engines while the engine is working, and forced lubrication to piston (50 b.h.p. size and over); a patent sensitive governor secures gas consumption in exact proportion to work done; lastly, the engines are specially designed to work with suction gas and with low fuel consumption.

HORNSBY-STOCKPORT GAS ENGINE. General arrangement of Engine Room, showing Tanks, Exhaust, &c., for Engine working with Town Gas.

Our second illustration gives a sectional view of the Hornsby-Stockport suction gas plant. The four main parts are:—A, the generator, lined with firebrick, in which the gas is made; B, the vaporiser for producing the steam from which the gas is made; C, the scrubber for cooling and heat-

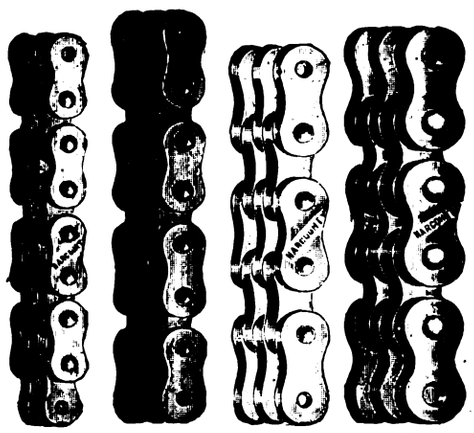
ing the gas; and D, the reservoir box from which the engine draws its supply.

No gas is generated at pressure, so there can be no leakage or smell, and there is no gas-holder, as the gas is only made as the engine draws it. Very little attendance is required; the fuel is replenished about every four hours.

The apparatus stands in very little space, either inside or outside the engine house.

It is not necessary to fix the plant close to the engine, and two or more engines can be worked from the same plant if suitably arranged.



A BURMA CONCRETE BRIDGE.

AT the last meeting of the Society of Engineers a paper was read on "The Sinlumkaba (Burma) Ferro-concrete Bridge," by W. E. Haldwell, B.A., M.S.E. The author described the methods adopted in constructing a reinforced concrete arch bridge over a bridle road in a mountainous tract of country in Upper Burma. Apart from the particulars of construction contained in the paper, the descriptions gained an added interest from the fact that this, the Sinlumkaba Mill Bridge, is the first reinforced concrete bridge to be erected in Burma.

The bridge was constructed by the Burma Public Works Department, and is in one span of 40 feet, with a rise of 12 feet in the arch, the entire width of the bridge being 9 feet, and the width of the roadway inside parapets 6 feet. The level of the crown of the arch is 8 feet above the highest known flood level. The entire arching was made of cement concrete, with two layers of reinforcing bars, the bottom layer being placed 1½ inches above the intrados, and the top layer 1½ inches below the extrados of the arch. The longitudinal reinforcing bars were placed 9 inches apart, with cross bars at right angles to them, at intervals of 2 feet, both longitudinal and cross bars (which were all ½ inch thick) being wired together at their intersections with

⅛-inch wire. The thickness of the arch at the crown was 10 inches, and at the haunches 3 feet 9 inches. Thus the distance between the two layers of reinforcement was 7 inches at the crown and 3 feet 6 inches at the haunches. The backing of the bridge was formed by parallel spandrel walls, made of coursed rubble masonry in lime mortar, 4 feet wide at the bottom and 2 feet in width at the crown level of the arch. At this level a masonry wall 1 feet 6 inches in thickness was built along either side of the arch for a height of 1 foot, thus acting as a retaining wall for the filling in over the crown, and on this wall the masonry parapet pillars of the bridge were built and connected by ⅞-inch square iron bars, which formed the railing.

NEW SOUTH WALES SCAFFOLDING AND LIFTS ACT.

THE following is the report of the Chief Inspector of Lifts and Scaffolding covering the work of the year, and indicating that considerable progress has been made in the interests of public safety:—

The number of notices received, stating intention to erect scaffolding, was 1,157. This does not indicate the actual number of scaffoldings erected, or that have come under the supervision of the inspectors, as a considerable number do not come within the statutory definition of "scaffolding," which definition comprises only such structures that are built up or fixed to a height of 8 feet from the horizontal base. But under the definition "gear" all scaffolding where located is subjected to the closest scrutiny on the part of the inspectors. On the average the two officers appointed to these duties effect fifteen to twenty inspections per day each.

An effective check upon building operations is still maintained by the regular receipt of the building notices forwarded by the Metropolitan Board of Water Supply and Sewerage and the Municipal Council of Sydney.

In the City, building operations have been particularly extensive, and a great amount of difficult work has been carried out in increasing the height of existing buildings. This latter work invariably requires gear and scaffolding of a complex character, and it is noted with satisfaction that upon this class of work no casualties to the public or employees have occurred. In connection with building operations generally, there have been recorded eighteen casualties and four fatalities, not one of which could be traceable to defective scaffolding or gear. Three of the fatalities occurred through falls from roofs, and in the remaining case the unfortunate deceased inadvertently stepped backwards down a hoisting well. The number of cranes and hoisting engines erected and used in the Metropolitan district is:—Hand cranes 100, steam cranes 22, electric cranes 4, steam hoists 36, electric hoists 8. In the Metropolitan district ninety-four new lifts were erected. Specifically they are as follows:—Electric lifts 52, hydraulic lifts 33, belt-driven lifts 9. The number of lifts in commission to date are:—Electric lifts 224, hydraulic lifts 679, belt-driven lifts 50. There occurred two fatalities and several casualties in connection with lifts, due to the careless and indiscriminate method adopted in operating these machines. No fatalities or casualties are reported in connection with the operations of the Act in the Newcastle district, and the Inspector there reports that, generally, the provisions of the Act are conformed to. The number of lifts in the district totals twenty-one, and notifications have been received covering the erection of five electric lifts. During the year new regulations were proclaimed under the "Scaffolding and Lifts Act, 1902," providing for the use of iron or steel scaffolding for bricklayers or plasterers, iron or steel fastenings for scaffolding, and approved brackets of the same materials for plasterers, tuck-pointers, &c.

An amending Bill has been drafted, the main features of which are to provide for none but certificated attendants being in charge of passenger-lifts; supervision of goods-lift attendants; the certification of persons in charge of power cranes and hoists used for any purpose, and for the direct observance of the regulations.

AT the next meeting of the United Synagogue in London a special committee will present its report on the demolition of the New Synagogue in Great St. Helen's, the site of which is said to be worth 100,000*l*. It is proposed to amalgamate the New Synagogue with the Hambro' in Union Street, Whitechapel. At a cost of 25,000*l*. the Hambro' will be rebuilt to accommodate 1,000 worshippers.

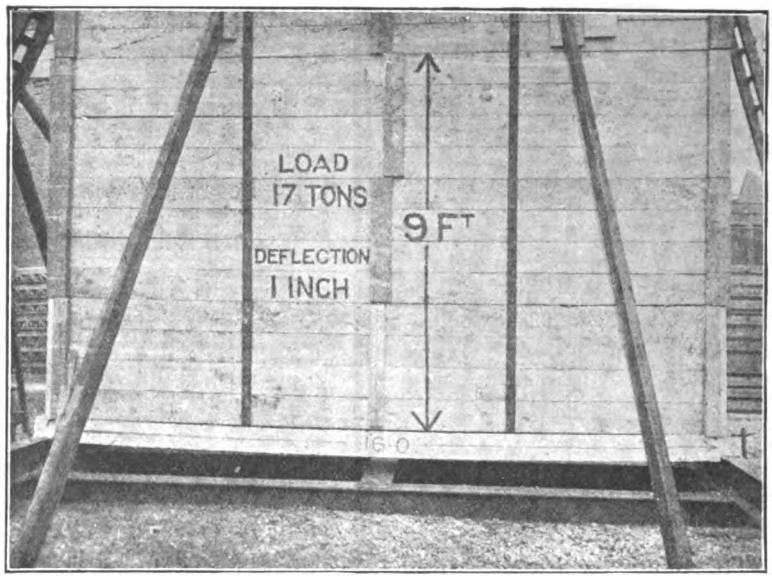
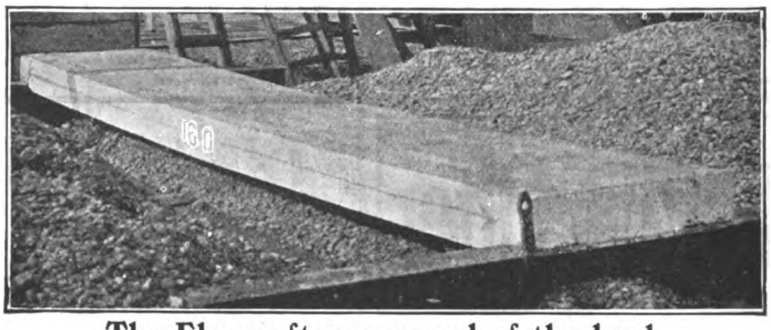
FAWCETT'S MON'LITHCRETE



STEEL GIRDERS

are lattice girders minus compression web members, and in combination with concrete are more than double the strength of joists of equal weight.



For prices per ton and for estimates apply:—

Fawcett Construction Co., Ltd.,

Tunnel Avenue, East Greenwich.

14 cwts. per foot super. on Mon'lithcrete Floor.

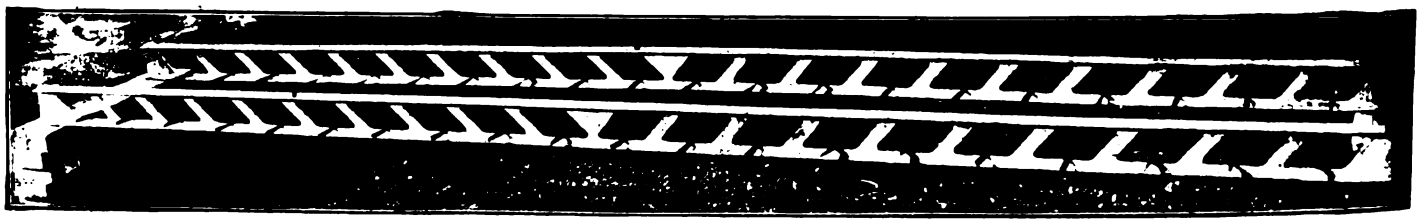
The Floor after removal of the load.

Distributed Load in cwts. that one foot will carry at one-fourth the breaking weight—

(63)

Divide by the span in feet and by the working load in cwts. to find the Spacing in Feet.

EXAMPLE.



Span 15 Feet.

Load 1½ cwts. per foot.

Or about 2′ 9″ to 2′ 10″ Centres.

Mon'lithcrete Girders in combination with Concrete are safer than Reinforcing Bars.

"The general results of the tests must certainly be considered as highly satisfactory, and as substantiating the claims put forward on behalf of this method of floor construction in respect of strength and rigidity."—THE BUILDER, February 20, 1909.

"It is claimed for this system of construction that it provides the same safeguard against the expansion of concrete as does the use of reinforcing bars, and this seems to be a justifiable claim, considering how perfectly the concrete is held by passing through the webs of the joists."—THE BUILDING NEWS, February 12, 1909.

"The aim of the inventor, Mr. Mark Fawcett, has been to obtain monolithic construction not by using concrete reinforced by bars and loose or fixed stirrups, but by using what might be described as lattice girders from which the compression members have been removed; in other words, rolled steel girders with large rhomboidal-shaped openings in the webs and tension bars pitched at an angle of 45° to the right and left of the centre, leaving the webs solid at each end to resist shear, whilst the top flanges are reduced to two-thirds the sectional area of the bottom flanges.

"The result is that the steel beams, reduced in weight 40 per cent. from the British standard, are capable of carrying at least 50 per cent. more load. The new floor has besides the advantage that an aggregate, as broken brick, can be used for the concrete, possessing greater resistance to fire and less conductive of sound than ballast concrete ordinarily employed in reinforced work."—THE ARCHITECT, February 26, 1909.

Mon'lithcrete Girders have known strength like ordinary steel joists.

Printed by SPOTTISWOODE & CO. LTD., at No. 5 New-street Square, E.C., and Published for the Proprietors by P. A. GILBERT WOOD, at the Office, Imperial Buildings, Ludgate Circus, London, E.C.—*Friday, June 11, 1909.*

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

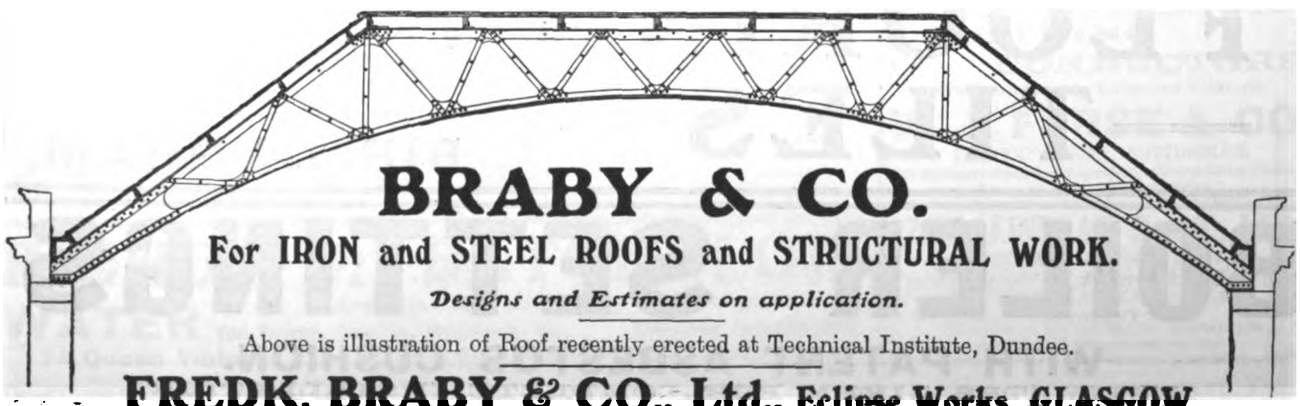
Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.



BURSLEM.—July 17.—For new public buildings. The author of the design placed first by the assessor will carry out the work. The architects placed second and third will receive premiums of 100*l.* and 50*l.* respectively. Deposit 2*l.* 2*s.* Mr. F. Bettany, borough surveyor, Burslem.

DEPTFORD.—Sept. 1.—The Metropolitan Borough Council of Deptford invite designs for a branch library at New Cross, S.E. Premiums of 50 guineas, 25 guineas and 10 guineas will be awarded. THE Croydon Town Council are about to construct a low-level reservoir and waterworks, at an estimated cost of 90,000*l.*, on a site at Russell Hill.

MESSRS. R. WAYGOOD & CO., LTD., held their ninth ordinary general meeting on Wednesday last, Mr. Henry C. Walker, the chairman of the company, presiding, and in spite of the depression in the building trade, they were enabled to declare the same dividend as last year.

THE asylum visiting committee of the Middlesbrough Corporation had before them at their last meeting alternative proposals for the erection of six additional workmen's cottages in Marton Road, at a cost of 275*l.*, 280*l.* and 300*l.* per house respectively. No decision was arrived at by the committee.

TRADE NOTES.

THE Phœnix Assurance Company is now prepared to undertake the duties of trustee and executor.

A MON'LITHCRETE floor is in course of construction at Messrs. Champion & Slee's vinegar works. Mr. Kennard is the architect.

A NEW bank is in course of erection at Manningtree for Messrs. Barclay, from the design of Mr. John Corder. The floors are to be fireproof on the Fawcett system.

WE regret to announce that Mr. Alfred Liebert, for a great many years manager to the Calmon Asbestos Slate Company, died last week, after a short illness. He was held in high esteem by all who had dealings with him.

SIR HENRY SCOTT has just given orders to Messrs. John Smith & Sons, of Derby, to make a new chiming clock with three large dials for the parish church at Blackwell, near Alfreton.

MESSRS. BROOKES, LTD., the proprietors of the Hard York Non-slip Stone, announce that owing to the increase in their business they have been compelled to move to more commodious London offices and showrooms at Caxton House, Westminster, S.W., where they will exhibit samples of their Silex and Non-slip stones, granites and glazed bricks.

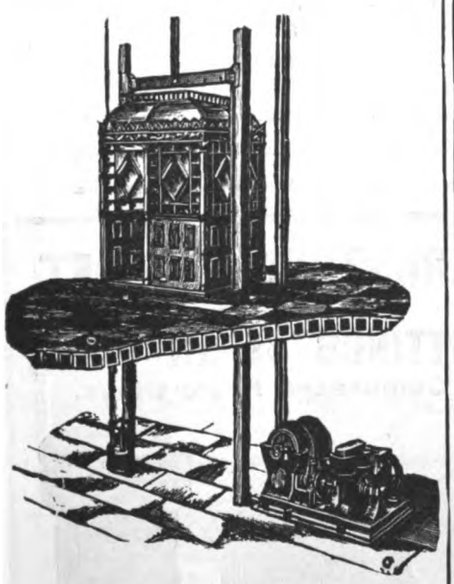
THE Sussex Portland Cement Company, Ltd., of Newhaven, have issued a block calendar for July 1909 till the end of June 1910, a month to each page. The sketch accompanying it shows the Auld Brig o' Ayr, this being one of the restoration works where the "Newhaven" brand of Portland cement is being exclusively used.

MESSRS. E. H. SHORLAND & BROTHER, of Manchester, are supplying their patent Manchester stoves to the Infectious Diseases Hospital, Lincoln, and the Clifton Asylum, York. Their patent exhaust roof and special inlet ventilators are being supplied for the extensions to the technical schools, Warrington, the Infectious Diseases Hospital, Lincoln, and the new Council schools, High Clarence.

A NEW smoke preventer is about to be placed on the market by the Furnace Appliances Company, of 9 Bedford Row, W.C., who state that very complete trials have been carried out during the past twelve months which have shown that any class of fuel may be smokelessly and economically consumed with their apparatus. They have also acquired the business of the British Fuel Economiser and Smoke Preventer, together with their works, offices, &c., and will commence operations on July 1.

MESSRS. ARTHUR L. GIBSON & Co., of 19, 20 and 21 Tower Street, Upper St. Martin's Lane, London, W.C., advise us that their new factory, Radnor Works, Strawberry Vale, Twickenham, is now in running order, and in future all orders received for their Kinnear patent steel rolling shutters will be filled from that address. Their offices and warehouse will remain for the present at the old address, in Upper St. Martin's Lane, London, W.C.

VISITORS to the Royal Agricultural Show, Gloucester, would be well advised to make a call at Messrs. Merryweather & Sons' Stand (No. 121), where they have a large exhibit of fire appliances and water-supply apparatus, suitable for country houses, farms and estates. Motor and horse-drawn fire engines are on view, as well as the useful little "Valiant" steam pump. This is a most handy machine, and, in addition to fire protection, is very useful for irrigation and general pumping purposes, while it can also be arranged for driving light machinery.



THE Strood Rural Council have approved a modified sewerage scheme for Halling which is estimated to cost 9,925*l*. Application is to be made for the necessary loan.

MR. JOHN T. WOODWARD, architect and surveyor, is removing his offices on Midsummer day to Garrick House, 27 Southampton Street, Strand, W.C.

THE Wirksworth Urban Council have agreed to engage Mr. Radford, engineer, of Nottingham, to report on the cost of a covered storage reservoir to hold 5,000,000 gallons, or less if water can be found to be available by gravitation.

THE Manchester waterworks committee last week opened the tenders for the laying of the first section of the third pipe from Thirlmere to the city. The section is from a point about two miles south of Ambleside to one about three miles south-east of Carnforth, and consists of about fourteen miles of 44-inch cast-iron pipes. The section passes under two lines of railway.

VARIETIES.

THE Worsley District Council decided on Monday to apply to the Local Government Board for permission to borrow 9,250*l.* for the erection of a technical school in Walkden Road, Walkden.

THE Plymouth Borough Council have adopted a scheme for the provision of stable and cart-shed accommodation at Prince Rock for the house refuse removal depôt at an estimated cost of 4,700*l.*

A CHURCH is to be erected in the working-class parish of St. Philip, Litherland, in the diocese of Liverpool. An anonymous donation of 10,000*l.* was recently given for the building of a memorial church in some populous and needy parish in the diocese.

THE Council of the London Chamber of Commerce at their meeting on the 10th inst. elected Mr. Henry Adams, M.Inst.C.E., F.S.I., &c. (Henry Adams & Son, 60 Queen Victoria Street, E.C.), a member of the arbitration committee of the Chamber in addition to the engineering committee, of which he has been a member for some years.

THE Guildford Board of Guardians have decided on the erection of a home for nurses at the workhouse, in accordance with plans approved by the Local Government Board, at a cost not exceeding 2,650*l.*, which will be borrowed for a period of not more than thirty years.

THE water committee of the Aberdeen Town Council, on the question of obtaining a new water supply for the city, has decided to apply to Parliament for powers to bring a supply from the River Avon, this being the scheme that has been under consideration for several years. The estimated cost is put at 835,000*l.*, but that sum will probably be exceeded.

IN the King's Bench Division on Tuesday, Charles Groves, engineer, of Clapham, sued Messrs. Dove Bros., contractors, Islington, for damages for personal injuries caused by the alleged negligence of the defendants. It was stated that the plaintiff, in July last year, had his legs broken and his hip injured through the collapse of a scaffolding erected by the defendants on the stage of Drury Lane Theatre. Defendants denied negligence, but the jury returned a verdict for plaintiff for 500*l.*

THE Corporation of Newcastle-on-Tyne have this week opened a number of houses intended for the poorest class. The dwellings consist of two blocks, containing altogether seventy-two dwellings, each consisting of an apartment 15 feet by 12½ feet, with bed in alcove and screened-off scullery. The buildings are on Corporation land, and the tenements are to be let at 3*s.* 6*d.* per week.

THE Stanmore estates of the late Mr. Frederick Gordon, which include Bentley Priory, Stanmore Park, and the Manor House and Woodlands estates at Stanmore, Middlesex, were sold by auction in London on Monday. They extend over 800 acres, and produce some 10,000*l.* per annum. A bid of 50*l.* in excess of the reserve was immediately made, and at the price of 275,050*l.* the estate was declared sold.

THE vicar and churchwardens of Harrow parish church have received authority from the Consistory Court to erect an addition to the vestry from plans prepared by Sir A. Webb, R.A., on consecrated ground at the north side of the parish church. The Court direct that between the floor of the vestry and the foundation on which it rested a concrete pavement should be laid, so that any unknown graves which might be beneath would be undisturbed.

MR. GILBERT BAYES is executing the memorial to Coquelin *aîné*, which English actors and actresses are to present to the Comédie-Française. It is to consist of a bronze shrine, Greek in form, over a female gilt figure emblematical of "Fame" holding a wreath of laurel in her hand. On the wall of the shrine are inscribed the names of the principal characters represented by Coquelin. The height of the shrine is 3 feet 6 inches.

THE Hartlepool Corporation have decided upon an important scheme for the improvement of the area at the corner of Corporation Road and Warren Street. The leases of the property in this area lapsed in December last, and, as soon as the land passed into the possession of the Corporation, the improvement committee took the matter in hand, with the result that a scheme has been approved by the Council for the transformation of the area. The land has been divided into nineteen sites, and these are now being offered by the Corporation for dwelling-houses for a lease of seventy-five years, the lessees to erect self-contained houses of not less value than 200*l.* each.

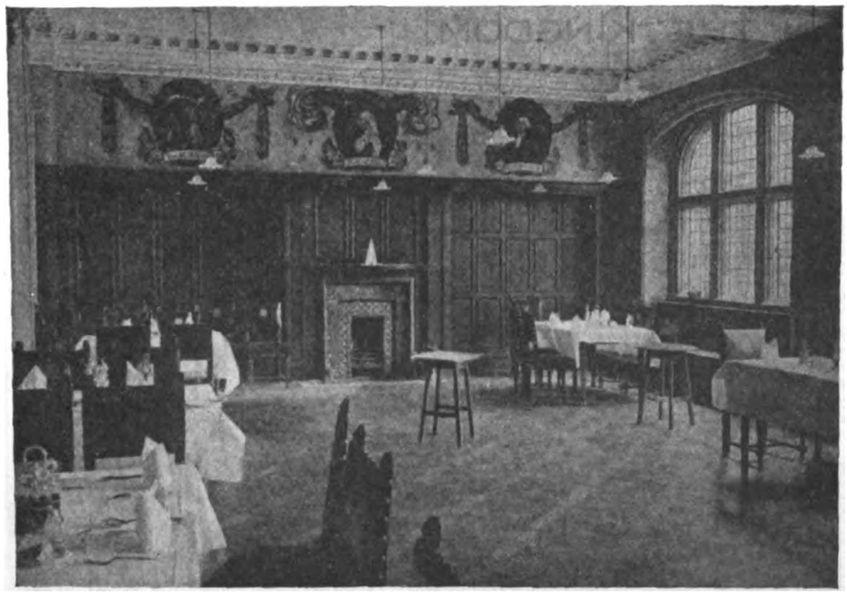
THE Dublin Corporation decided this week:—(*a*) That the paving committee be directed to take steps to ensure that in future no name which is un-Irish or anti-Irish in expression or sentiment shall be given to any new street, road, avenue, terrace, or other place taken in charge by the Corporation; (*b*) that the name-plates in future erected on any such new streets or other places shall bear names in the Irish language; (*c*) that the committee be directed to, if possible, complete the erection of bi-lingual name-plates on all streets, roads, avenues, &c., now in charge of the Corporation during the next five years; this paragraph not to refer to obsolete or unnecessary names on any terrace, row, or villa forming part of a road, street, or avenue, in which the numbers run consecutively, and the numbers on the houses of such terraces, &c., are what might be described as "street numbers."

THE Stafford Town Council have accepted the resignation of Mr. W. Blackshaw, the borough engineer. The following recommendations have been adopted:—(*a*) That on the appointment of a new borough engineer and surveyor the services of Mr. Blackshaw be retained in the capacity of consulting engineer and surveyor in connection with the various departments now under his supervision, that he be paid for such services a fee of 150*l.* per annum, and that this arrangement be reconsidered at the expiration of two years; (*b*) that a borough engineer and surveyor be appointed to succeed Mr. Blackshaw, the salary to be 275*l.* per annum, rising to 400*l.* by annual increments of 25*l.*; (*c*) that the committee be authorised to publish forthwith the necessary advertisement, examine the applications received, and select therefrom no fewer than three for submission to the Council at the meeting to be held on July 30 next.

IN the Court of Appeal, before Lords Justices Vaughan Williams, Moulton and Buckley, an application was made on Monday to fix a day for continuing the hearing of an appeal by the plaintiffs in the case of William Kennedy, Ltd., *v.* the Mayor and Corporation of Barrow-in-Furness, against an order of Mr. Justice Bucknill staying the action on the ground that the dispute ought to be referred to arbitration. The plaintiffs, who are a firm of Glasgow contractors, claim 31,264*l.* under a contract for the construction in connection with the defendants' waterworks of a dam and intake. The defendants' engineer had refused to give certificate of completion, alleging defects in the dam, and the plaintiffs contended that as he was the arbitrator mentioned in the contract he was not a fit person to adjudicate in the matter. The appeal was partly heard last March before Lords Justices Vaughan Williams and Kennedy, but was adjourned for the Barrow town clerk and the engineer to make affidavits, and it had since stood over owing to the absence of Lord Justice Vaughan Williams. It was now arranged that the appeal should be reargued before the Court as at present constituted on Monday next.



THE SMOKE NUISANCE AND THE LONDON COUNTY COUNCIL.

THE public control committee of the London County Council reported in February that they had had under consideration for a considerable time past the question of smoke nuisance in London and the means which may be adopted to remedy the evil. In their opening remarks they say that without any direct statutory control or responsibility in dealing with smoke nuisance from trade premises, the Council has some indirect control by virtue of its power of acting in default of sanitary authorities under the Public Health (London) Act, 1891. In the special cases of steam locomotives on railways, and locomotives on roads, the Council is able to take direct action, and has secured a very considerable reduction of nuisance from these sources.

Experience has shown that the principal enactments dealing with smoke are inadequate, and that important amendments are needed to furnish means for dealing effectively with the nuisance. All sources of smoke nuisance in London, except locomotives and domestic chimneys, are subject to the operation of Sections 23 and 24 of the Public Health (London) Act, 1891, but Sections 23 and 24 (*a*) are so crippled by qualifying words that it is difficult to obtain convictions under them. The only provision of real value—namely, Section 24 (*b*)—deals with black smoke alone, and this is the only portion of the smoke sections of the Act which is enforced by the majority of the Metropolitan Borough Councils.

The limitation of this effective section to black smoke is unfortunate, as very frequently smoke of other colour than

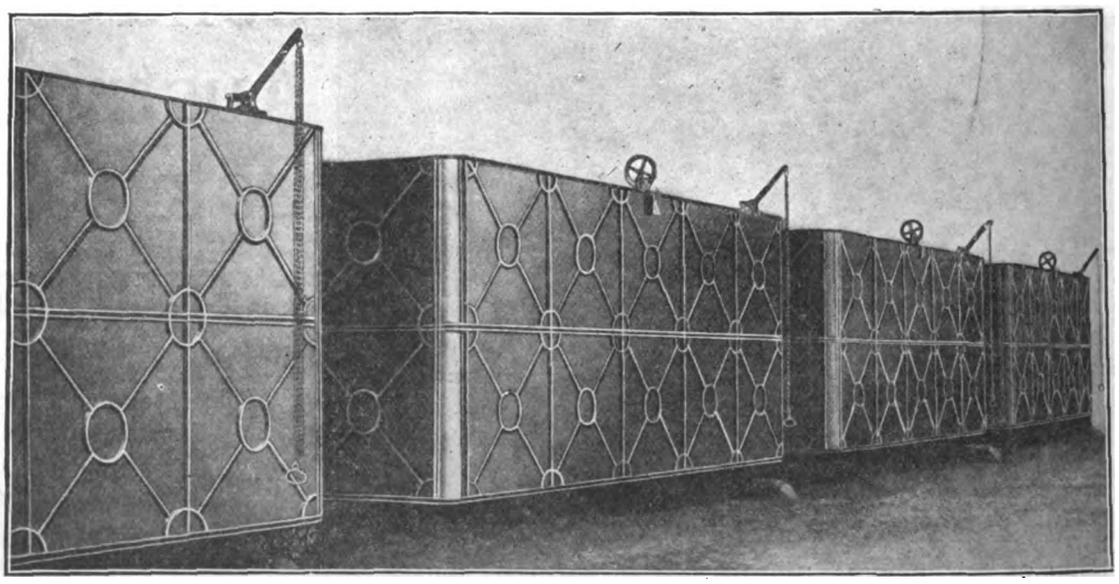
Digitized by Google

black is emitted in such volumes as to cause very serious nuisance, and yet, under the existing law, it is practically impossible to penalise the offenders. The extension of Section 24 (*b*) to cover any serious emission of smoke, irrespective of colour, would be most useful, and similar powers are to be found in the Public Health (Scotland) Act, 1897. A further reason in support of this proposal is the fact that in the year 1907 unsuccessful and costly proceedings were instituted by the Chelsea Metropolitan Borough Council against the Underground Electric Railways Company of London, Limited, and after a long trial, at which much expert and technical evidence was tendered, the case was dismissed, with 300 guineas costs against the Borough Council. The magistrate found that it had not been proved to his satisfaction that the smoke, the subject of the summons, was "black" smoke. It appears to us, says the committee, that a similar difficulty may possibly hereafter arise on this point, in which case the only section of the Act of 1891 which has been of real value will prove to be as unreliable as the other smoke provisions of the Act. The result of the proceedings also leads us to think that Metropolitan Borough Councils may desire the assistance of the Council in cases of special difficulty, and those which may possibly involve exceptional expenditure in connection with their conduct. Although the Council has power to act in default of a Borough Council, it is not in a position to assist in the manner indicated, and we think that this state of affairs should be remedied.

It has been found that some of the electric lighting corporations contend that they are exempt from penalties for smoke nuisance, as they allege that the nuisance arises in connection with the discharge of statutory obligations, and these corporations when applying to Parliament for new powers have endeavoured to obtain relief from the existing law relating to such nuisance. We see no reason why exemption should be granted to the corporations in question, as there is abundant evidence to show that their businesses can be conducted without causing nuisance from smoke, and we accordingly submit a proposal dealing with the matter.



It is also extremely desirable that Government property, which is now exempt from the provisions of the Public Health (London) Act, 1891, relating to smoke, should be brought under their operation, as both the Council and the Woolwich Metropolitan Borough Council have frequently had cause to complain of the serious smoke nuisance from the chimneys of the Royal Arsenal at Woolwich. In this connection we may remind the Council that the following resolution was passed at a conference of the Metropolitan Borough Councils, held on July 7, 1904, on the administration of the Public Health (London) Act, 1891:—"That, in the opinion of this conference, it is desirable that the provisions of the Public Health (London) Act, 1891, as to nuisances arising from the emission of smoke, should be applied to property in the possession of the Crown."

Much nuisance has arisen from premises belonging to Borough Councils, and only recently we had under consideration a serious nuisance from the electricity works of the Stepney Metropolitan Borough Council in Osborne Street, Stepney. Although technically within the statue, the nuisance is practically unpunishable and one in which the Council is without power to act in default. Having regard to the principle underlying the Public Health (London) Act, 1891, it seems reasonable to suppose that if the point had been considered when the measure was before Parliament the Council would have been given power to act in such cases. We think that it will be to the advantage of London if the Council is in a position to take proceedings in cases of this description, and, of course, action would be taken only when all other means of securing an abatement of a nuisance had failed.

Considerable nuisance from smoke arises from trade premises outside London, which nuisance is dealt with under the Public Health Act, 1875. For practical purposes the effect of the law is the same outside and inside London. When such smoke drifts into London and becomes a nuisance, proceedings can be taken by the authority whose district is affected, in pursuance of Section 14 of the Public Health (London) Act, 1891. In practice this limits the taking of action to those Borough Councils on the borders of London, as other Borough Councils find difficulty in proving that their districts are affected. All London, however, suffers more or less from a smoke nuisance of this description, and we therefore consider that the Council should also be in a position to take proceedings if such a course is found to be necessary.

With a view to framing legislation acceptable to all those concerned in the administration of the law relating to smoke

nuisance, we held on March 12, 1909, a conference with repeesentatives of the City Corporation and the Metropolitan Borough Councils, at which proposals Nos. (i.) to (iv.), submitted below, were very fully discussed and approved, with the exception of No. (iv.), which, if it becomes law, will empower the Council to take proceedings in respect of smoke nuisance created by sanitary authorities. We, however, place very great importance upon the proposal in question, and we think the Council will be well advised to proceed with it.

Serious smoke nuisance also arises from private houses. It is estimated that one-half of the smoke in London comes from this source, and at the present time does not come within the law. The smoke from each individual chimney may be slight, but when it is remembered that in winter probably one million domestic chimneys in London pour forth smoke daily into the atmosphere it is evident that the total volume of smoke must be very great. As indicating the great amount of smoke discharged from domestic chimneys it has been noticed that some of the densest London fogs have arisen on days when the great bulk of business premises have been closed, and a bank of smoke in London has been seen to rise to a height of at least 3,000 feet or 4,000 feet, and to be carried by the wind in a sunlight-obscuring trail to a distance of fifty miles.

Dr. W. M. Shaw, of the Meteorological Office, states that he finds from comparison of records that, owing to its smoke, London loses half of its sunshine in winter, and one-sixth in summer, and there can be no doubt that domestic grates contribute largely towards this evil. Many people advocate the abolition of the open fire in favour of the closed stove system in use on the Continent, but while undoubtedly the general adoption of such a system of heating would result in a purer external atmosphere, this would be secured at the sacrifice of much of the fresh air inside living rooms for which open fires, by providing a good deal of ventilation, are largely responsible. It is therefore unlikely that English people will abandon the open fire. Although, owing to the very nature of its construction, it seems impossible to combine in the open grate the essentials of smokeless combustion unless anthracite coal or coke be exclusively used, careful experiment and inquiry have shown that there are several open fire grates on the market which secure excellent combustion of coal and largely reduce the amount of smoke.

Much reduction of smoke nuisance from private houses may be expected through the growing use of gas and electricity for the purposes of heating and cooking, as it has been found that nearly half a million gas cooking-stoves are now in use in London, and their use is steadily increasing. It has been suggested that the amount of smoke could also be considerably reduced by adopting systems of central heating, but we are of opinion that to diminish domestic smoke materially it is necessary to educate public opinion on the subject, and a step in this direction is the instruction which is given to children in elementary schools in the principles of combustion, so as to make them grasp the fact that smoke is not inevitable, but often results from the wasteful use of fuel.

We do not propose at the present time to suggest any action to deal with nuisance from this source, but it may be found necessary at some future time, unless public opinion brings about some radical improvement, to give serious attention to this grave problem.

Considerable inquiry, however, would be necessary before ameliorating measures could be proposed, and we think that the opportunity should now be taken of placing the Council in a position to expend money for the purpose.

As required by standing order No. 163, we have to state that we are advised by the solicitor that the Council has power to promote legislation in the direction above indicated, provided that the provisions of the Borough Funds Act, 1872, as applied by the County Councils (Bills in Parliament) Act, 1903, are complied with, and we recommend:—

(*a*) That, as regards nuisance from smoke in the County of London, application be made to Parliament in the session of 1910 to give effect to the following proposals:—

(i.) That Section 24 (*b*) of the Public Health (London) Act, 1891, which provides that "any chimney (not being the chimney of a private dwelling-house) sending forth black smoke in such quantities as to be a nuisance" shall be a nuisance liable to be dealt with summarily under the Act, should be amended by the deletion of the word "black."

(ii.) That the word "chimney" in Section 24 (*b*) of the Public Health (London) Act, 1891, should be deemed to include:—(*a*) Openings through which smoke is emitted from

Digitized by Google

buildings or places in which processes of manufacture are carried on, and the chimneys of any building or place where furnaces are used in operations carried on under statutory powers; (*b*) the chimneys of any Government workshop or factory.

(iii.) That in special cases of nuisance arising under Sections 23 and 24 of the Public Health (London) Act, 1891, the proceedings in respect of any nuisance may, at the request of and by agreement with the sanitary authority, be taken by the Council in such special cases.

(iv.) That the power of the Council to take proceedings in respect of nuisance created by sanitary authorities under Section 22 of the Public Health (London) Act, 1891, should be extended to apply to smoke nuisance from electricity or other industrial works, or from premises used for the treatment or disposal of refuse, or for disinfecting purposes, or from baths or wash-houses or other buildings or wharves owned, leased, or occupied by sanitary authorities in which furnaces are used.

(v.) That the power of sanitary authorities under Section 14 of the Public Health (London) Act, 1891, to take proceedings in respect of nuisance arising outside their respective areas should be extended to the Council as regards smoke nuisance arising outside the County of London.

(vi.) That the Council should be empowered to expend such money as it may think expedient, not exceeding 500*l*. a year, for the advancement of measures for the abatement of smoke nuisance.

(*b*) That the costs and expenses of promoting the legislation referred to in the foregoing resolution (*a*) be defrayed out of the county fund.

The finance committee have prepared the following report on the above recommendations:—

The public control committee are recommending the Council to apply in the session of 1910 for an amendment of the law relating to nuisance from smoke, and for power to enable the Council to expend sums not exceeding 500*l*. a year for the advancement of measures for the abatement of the smoke nuisance. No estimate is put forward in respect of the cost involved in administering the powers to be sought, which include the extension of the Council's power for the Council to act in default of the local authority, and power for the Council to act directly in certain special cases of nuisance. At present the expenses of the Council in acting in default of the sanitary authority are recoverable from the latter. Under the proposals of the public control committee the administrative expenses of this Council would be chiefly in connection with proceedings against sanitary authorities, and in respect of nuisances arising from sources outside the county.

We see no objection, from a financial point of view, to the proposals of the public control committee so far as they relate to the strengthening of the powers of the Borough Councils in this matter. We view with apprehension, however, any proposal which might involve the Council in increased expenditure of an unascertained amount in connection with the administration of any powers which may be conferred upon the Council as the result of the legislation now proposed, and we are not prepared, in the absence of any estimate as to the expenditure to which the Council may be put, to endorse the proposals of the public control committee, so far as they relate to such additional powers.

THE Doncaster Rural District Council have instructed Messrs. D. Balfour & Son, of London and Newcastle-on-Tyne, to report upon the best means of sewering, and also disposing of the sewage of a portion of Adwick-le-Street, and also for the parishes of Owston and Skellow in their district, which is urgently required owing to important colliery developments in that neighbourhood.

THE Darfield Urban District Council have received the sanction of the Local Government Board to the carrying out of a scheme of sewage disposal prepared by Messrs. D. Balfour & Son, civil engineers, London and Newcastle-on-Tyne, for the town of Darfield, near Barnsley. The work consists in the construction of screening and detritus tanks, from which the sewage will flow into a storage tank and be pumped by oil engines and centrifugal pumps to a receiving tank, from which it will gravitate to the liquefying tanks. The tank effluent will flow to a dosing chamber, from which it will be distributed on to primary and secondary percolating filters, and after flowing through humus chambers will be discharged into the River Dearne.

KAHN TRUSSED BARS

FOR

REINFORCED CONCRETE.

Here are a few points which deserve careful thought:—

(1) The Kahn Bar is the only one with RIGID STIRRUPS.
(2) The STIRRUPS are an INTEGRAL part of the main tension member.
(3) The stirrups are bent to an angle of 45 degrees.
(4) The stirrups are automatically sheared and spaced.

The above characteristics of the KAHN BAR are of *vital* importance, and form an unparalleled combination not to be found in any other Reinforcement. They mean:—

(1) That no work is required on site.
(2) The important work of spacing shear members is not left in the hands of workmen.
(3) The stirrups absolutely prevent failure by shear.
(4) The stirrups, being bent to an angle of 45 degrees, afford complete reinforcement to every portion of a concrete beam.
(5) Speedy and efficient construction is assured.
(6) That as the stirrups are rigidly attached to the main bar, slipping is impossible.

TO HELP ARCHITECTS and ENGINEERS to readily see how the Kahn Bar fulfils these claims we have had SPECIALLY PREPARED A MODEL ALUMINIUM BAR, which we shall be glad to send on application FREE to those applying on their professional stationery.

THE

Festiniog District Slate Quarry Proprietors' Association

THE Members constituting this Association, whose names are subjoined, beg to notify Architects and the trade that they are the producers of the genuine **Portmadoc Slates,** and would respectfully invite co-operation in discouraging the sale of other, and inferior, slates as such.

¶ The Members will be pleased to supply Acid, Water and Breakage Tests, with full Analysis; also a list of important Government and public buildings upon which their slates have been used during the past 100 years.

¶ Portmadoc Slates contain, according to analysis, only **1** per cent. of lime, whereas the imitation composite slates, now extensively advertised, show much variation; samples recently analysed contain upwards of **40** per cent. of this highly perishable substance, and are liable to an absorption of moisture **forty** times as great as that of Portmadoc Slates.

Avoid uncertainty and worry by insisting on your Concrete being reinforced with

The PERFECTOR TRUSSED BAR

the **only** Bar which has the correct number of Shear Members irremovably attached.

The Bar is so firmly anchored at so many points that it is impossible to stress the Steel sufficiently to destroy the adhesion of the Concrete, consequently all the ideal advantages of Reinforced Concrete are preserved.

The only system which is proof against the carelessness of workmen.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BURSLEM.—July 17.—For new public buildings. The author of the design placed first by the assessor will carry out the work. The architects placed second and third will receive premiums of 100*l.* and 50*l.* respectively. Deposit 2*l.* 2*s.* Mr. F. Bettany, borough surveyor, Burslem.

DEPTFORD.—Sept. 1.—The Metropolitan Borough Council of Deptford invite designs for a branch library at New Cross, S.E. Premiums of 50 guineas, 25 guineas and 10 guineas will be awarded. "HESTIA" GRATES WITH BLOWER
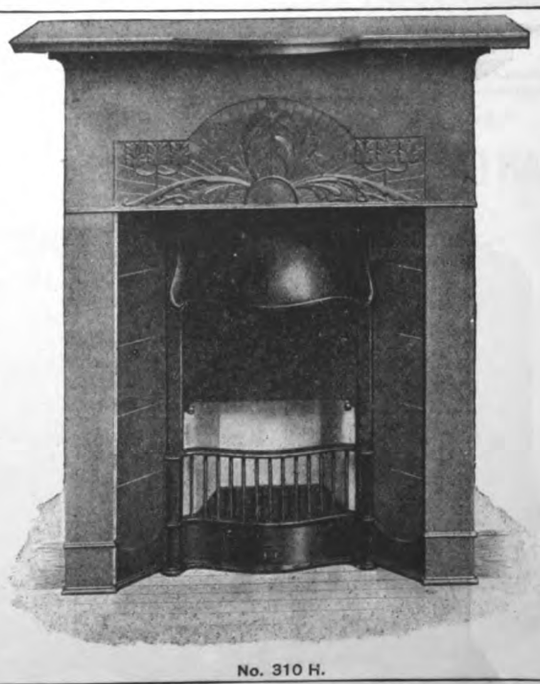
Register, Interior, or Mantel Register.



(PATENT)

Blower, Swing Canopy and Damper combined.
SIMPLE in CONSTRUCTION and ACTION (no part can get out of order).
BLOWER is hidden behind canopy when not in use, and when wanted is EASILY LOWERED and REPLACED (no fastening required).
BLOWER quickens or revives a fire.
DAMPER and CANOPY save fuel and completely control combustion.
ARTISTIC, CONVENIENT, INEXPENSIVE.

The "Hestia" Grates hold the Certificate of the Incorporated Institute of Hygiene.

WE GUARANTEE SATISFACTION.

TRADE NOTES.

MR. R. T. BECKETT, architect, is moving his office from Liverpool to 7 Abbey Buildings, Chester, on June 28.

MACKAY'S patent direct-acting ventilators, supplied by Messrs. Cousland & Mackay, Glasgow, the sole makers, have been used for the ventilation of the New Bridge Street U.F. Church, Alexandria, erected from the plans of Messrs. H. & D. Barclay, architects, Glasgow.

AMONG the clocks recently erected by Messrs. Wm. Potts & Sons, of Leeds and Newcastle, or recently ordered, are an illuminated turret clock and pier clock with bells, at Bournemouth, a clock with three dials at Castle Rock Church, Londonderry, and a new clock at the parish church, Kirkby Malzeard, near Ripon.

MESSRS. GEORGE MILLS & CO., LTD., engineers, Radcliffe (proprietors of the "Titan" Sprinkler), have received the following letter from the *Manchester Guardian*, Ltd.:—"You will be interested to hear that a fire occurred here on the 14th inst., simultaneously with the explosion in Deansgate, and that the sprinklers which you installed for us last year acted promptly, not only keeping the fire down in a rather dangerous spot just under the roof, but giving the alarm on the gong. The fact that the fire occurred in the highest part of the building makes the test as complete as we could well desire, and we need hardly say that we have every reason to be pleased that we installed them."

J. G. CHILDS & CO., LTD., electric and hydraulic engineers, Willesden Green, N.W., are exhibiting at the Royal Agricultural Show, Gloucester, this week. The principal feature is a 24-feet diameter plant, which consists of their special turbine upon a steel tower 60 feet high, with vertical shaft driving a Morris Hawkins variable speed generator placed vertically at fifty volts, and charging a twenty-eight cell Pritchett & Gold battery, having a discharge capacity of 450 ampere hours. They are lighting the show cottage of the Country Gentlemen's Association, 200 yards distant, and supplying current for working an electric grill there by means of the wind turbine. Another point of interest is that the storage battery is divided into two parts; fifty volts can be used for working the cooking apparatus and other machines exhibited, and 25 volts for the lighting. The plant also supplies energy for many of the other exhibits.

VARIETIES.

THE National Art Collections Fund have removed their offices to Queen Anne's Chambers, Broadway, Westminster, S.W.

THE Royal Oak Hotel, at Bowness, in the Lake District, is shortly to be enlarged and altered from the plans of Mr. J. Hutton, architect, of Kendal.

MR. W. S. MAXWELL, of Gainsborough, has been appointed surveyor of the Horncastle North District. The salary is 140*l.* a year, and there were eighty-five applicants.

THE Branksome Tower Hotel, Bournemouth, is to be considerably enlarged. The plans, which have been prepared by Mr. H. E. Hawker, architect, Bournemouth, provide for thirty-two new rooms, and the alterations and extensions have received the necessary magisterial sanction.

GLASGOW libraries committee recommend that, in place of Arbroath stone stairs, as included in the estimate for the new Mitchell Library in North Street, stairs formed of reinforced concrete be substituted, the treads and risers to be covered with marble, at an estimated extra cost of about 250*l.*

MR. A. W. SMITH, F.R.I.B.A., Maidstone, has prepared plans and estimates for the erection of a hospital for the Maidstone Rural Council at a cost of 6,400*l.*, exclusive of site. The matter has been deferred for further consideration.

MR. H. H. COUZENS, A.M.I.E.E., has been appointed chief electrical engineer for the borough by the West Ham Town Council. Mr. Couzens is at present deputy electrical engineer at Bristol. The salary is 500*l.* per annum, rising to 700*l.* by annual increments of 50*l.*

THE Chelmsford education committee reported last week that Mr. W. H. Pertwee, the architect for the proposed school in Hill Road, which site had been abandoned, was prepared to accept 75*l.* for preparing those plans in view of being appointed architect for the schools in Trinity Road. The bill was for 100*l.* It was agreed to settle the account at once.

THE Birmingham Board of Guardians have agreed to the erection of a new laundry at the workhouse in accordance with plans prepared by Mr. W. H. Ward, at an estimated cost of 5,200*l.*, including machinery. The report of the

RECENT TESTIMONIAL.
[Copy] 46 Newcastle St, London, E. June 8, 1909.
GENTLEMEN,—You will no doubt be pleased to hear that the "Sine Qua Non" Range we recently had from you is giving every satisfaction; we understand that the amount of coal consumed is practically one half of what the old range consumed.
We have, under the circumstances, strongly advised our client to have another "Sine Qua Non" fixed, and so save the other half.
We are, Gentlemen, yours faithfully,
(Signed for A. EATON & CO., LTD.,)

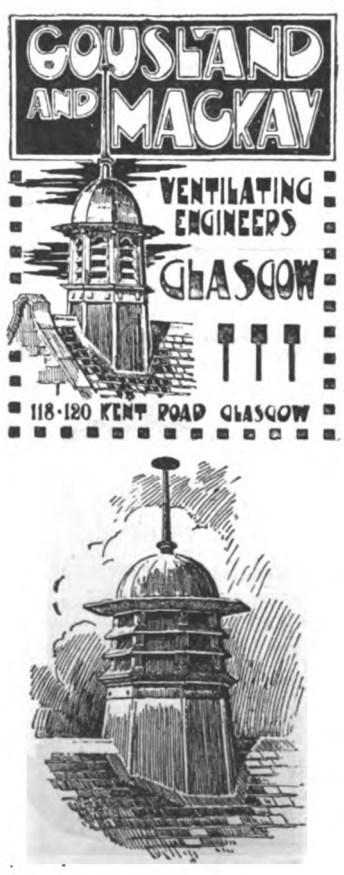
infirmary management committee recommending the adoption of plans for a matron's house at an estimated cost of 600*l.* was also agreed to.

A COMMITTEE has been formed to promote a national memorial to Gainsborough in his native town of Sudbury. The original scheme was limited to the county of Suffolk, but a meeting held at the House of Commons determined to make a general appeal for funds. A committee was formed, with the Marquess of Bristol as chairman, and has held two meetings. The committee ascertained that a statue by one of the best artists would cost 2,000*l.*, half of which has been promised.

MESSRS. EDWIN FOX & BOUSFIELD will offer at auction on Wednesday next at the Mart, Tokenhouse Yard, the freehold residential property "Bowden House," Harrow-on-the-Hill, with grounds extending to nearly thirty acres. The land has a frontage of about 1,600 feet to the London main road, and along the west side is a grass lane which will probably become a leading thoroughfare. The estate presents, therefore, large building prospects.

THE Liverpool Green Room Amateur Dramatic Society, Mr. B. A. Malandrinos, president, are considering the advisability of erecting a centrally situated hall in Liverpool, suitable for concerts, recitals, lectures, and stage plays, and capable of accommodating about 700 people. It is believed such a building could be provided at a cost of 14,000*l.* inclusive of site.



THE sanitary and plans committee of the Middlesbrough Corporation held last week a special meeting to consider a report recommending the adoption of the water carriage system. It was pointed out in the joint report by the Borough Engineer, Medical Officer, and Sanitary Inspector that under the Public Health Amendment Act, 1907, the Corporation could now demand water-closets in every new building. They recommended this to be done, also the gradual abolition of the existing pan-closets and privy middens, of which there were about 17,000 in Middlesbrough. The cost of conversion would be about 95,000*l.* The committee agreed that the Corporation adopt the Act, also that no building plans be passed in future which do not provide water-closets.

AT the last meeting of the Wexford County Council a letter was read from the Local Government Board stating that of the twenty-three candidates whose names were submitted for the position of County Surveyor, eleven were qualified for appointment. Of the twelve others, five withdrew their application or did not attend the examination, five failed, and two were ineligible. There were only four candidates before the Council—viz., William Fitzgerald Barry, Co. Surveyor, Monaghan; Robert B. Chillingworth, 21 Charlemont Place, Dublin; Stafford Gaffney, 46 Northumberland Place, Dublin; and Ignatius O'Sullivan, Highland Railway, Inverness, Scotland. Mr. S. Gaffney was ultimately elected.

MR. NATHAN SOLOMON JOSEPH, F.R.I.B.A., 18 Porchester Terrace, Bayswater, W., died on the 11th inst., at the age of seventy-five. He became a member of the Institute forty-six years ago, and had considerable practice, especially in the construction of dwellings for the working classes. He was architect to the Guinness Trust and the Four per Cent. Industrial Dwellings Company, and was also employed for similar work by the London County Council and other public bodies. Mr. Joseph retired six years ago.

IT was reported on Tuesday at the meeting of the Middlesbrough ferry committee that the contract with Sir William Arrol & Co., of Glasgow, for the construction of the transporter bridge at Middlesbrough had been completed, and the firm were about to proceed with the work. The committee decided to advertise for quotations for the testing of the steel to be used for the bridge. The steel is to be made in the Glasgow district, and the testing will be at the manufacturers' works.

THE Blackrock Urban Council (Ireland) have received a letter from the Local Government Board stating that they had received the report of their chief engineering inspector, Mr. Cowan, on the inquiry held into the application of the Council for sanction to a loan of 14,500*l.*, for the purpose of erecting working-class lodging-houses. The plans submitted for the buildings could, it is remarked, be materially improved, as indicated by the Inspector at the inquiry, and the Council would do well to obtain the advice of an architect who has had special experience of such work. The proposal to erect sixteen houses to be let at 8*s.* a week seems to the

Digitized by Google

Board questionable, as the rent appears excessive for houses to be erected under the Acts in Ireland, and it is doubtful if such rents could be secured. An architect is to be appointed.

THE Shrewsbury Town Council have adopted the recommendation of the improvement committee for the erection of new stables and depôt at Renshill for the accommodation of the horses of the Corporation, for office stores, carpenter and blacksmith's shop and other conveniences, at a cost of about 8,000*l*. It was pointed out that the scheme, owing to the position of the new stables and yard, would effect a saving of at least 200*l*. per annum in time and labour. The report was also adopted of the sanitary committee, who advised the erection of a public slaughter-house at Renshill at a cost of 8,080*l*., including the cost of land and existing private slaughter-houses in that vicinity.

AT the Mansion House, Mr. Alderman Howse some weeks ago dismissed a summons brought by J. Lyons & Co., Ltd., against the Corporation, under the Public Health Act, for failing to remove rubbish from a restaurant in the Poultry. The firm appealed in the High Court. The case raised the question whether the refuse of an eating-house or restaurant was "house" or "trade" refuse. The Lord Chief Justice said they were convinced that the refuse in question was house refuse. Therefore the appeal would be allowed. He hoped that the question would be further argued before the Court of Appeal, and, if necessary, before the House of Lords, because it was of considerable difficulty and importance.

AT a recent meeting of the Swadlincote Urban Council a letter was read from Mr. Carnegie, the donor of the public library, in reply to a letter from the Council asking him to make up a deficit of 317*l*. 10*s*. on the building scheme. Mr. Carnegie's reply to the request was that if the Council had been a little more economical in laying out the funds, the application would not have been necessary. It was absurd, the letter proceeded, that planning, supervision, and expenses of the competition for and preparation of designs should come to 13 per cent. of a total expenditure of 4,000*l*.; and, in view of the fact that Mr. Carnegie had sent 202*l*. in June of last year to meet the deficit, he failed to see how they could reasonably ask for the present deficit to be made up. A member said the architect led the committee to believe that, whatever accounts he passed, Mr. Carnegie would pay. No action was decided upon.

THE Belle Steamers announce that the starting time of the Nore steamer from Fresh Wharf, London Bridge, has been altered on Sundays from 1.30 P.M. to 2.30 P.M. This will enable people residing in the suburbs to reach the metropolis in time to catch the steamer. The boat will call en route at Greenwich at three o'clock, North Woolwich at 3.30, and proceed to Gravesend and round the Nore lightship and back to the same piers. Commencing July 5 trips will be run on Mondays, Thursdays and Saturdays to the Nore, leaving an hour earlier than the above times, and will call at Southend and Sheerness. Special steamers will leave Fresh Wharf at 10 A.M. to view the fleet in the Thames on July 19, 20, 21 and 22. Full details can be obtained on application to Belle House, Fish Street Hill, E.C.

THE Special Commission of the executive officers of the British Fire Prevention Committee, which visited Berlin and Hamburg, have returned to London. The commission comprised Mr. Edwin O. Sachs, F.R.S.Ed. (chairman), Mr. Ellis Marsland (honorary secretary), Messrs. Percy Collins, J.P., and J. Herbert Dyer (members of the Executive), Mr. Horace Folker (honorary auditor), and Major Maitland Coffin, F.R.C.P. (honorary medical officer). The questions examined by the commission on the journey related chiefly to the construction of large drapery stores, warehouses, theatres, schools, and hospitals. The commission also viewed a number of petroleum stores, scenes of fires, and they had an opportunity of inspecting a number of new fire stations, and of witnessing demonstrations with modern fire appliances. On their journey outwards they visited Hanover, and some of the members of the commission also visited Kiel. At Berlin the occasion of the visit was taken by the Chief Officer of the Royal Police Fire Brigade to arrange a special display of the working of his brigade. The arrangements for the journey having been carefully prepared in advance, and the authorities having put all possible facilities at the disposal of the commission, a very large number of useful data was obtained, and it is intended, as on previous occasions, to publish the data together with illustrations in a report to be issued by the British Fire Prevention Committee.

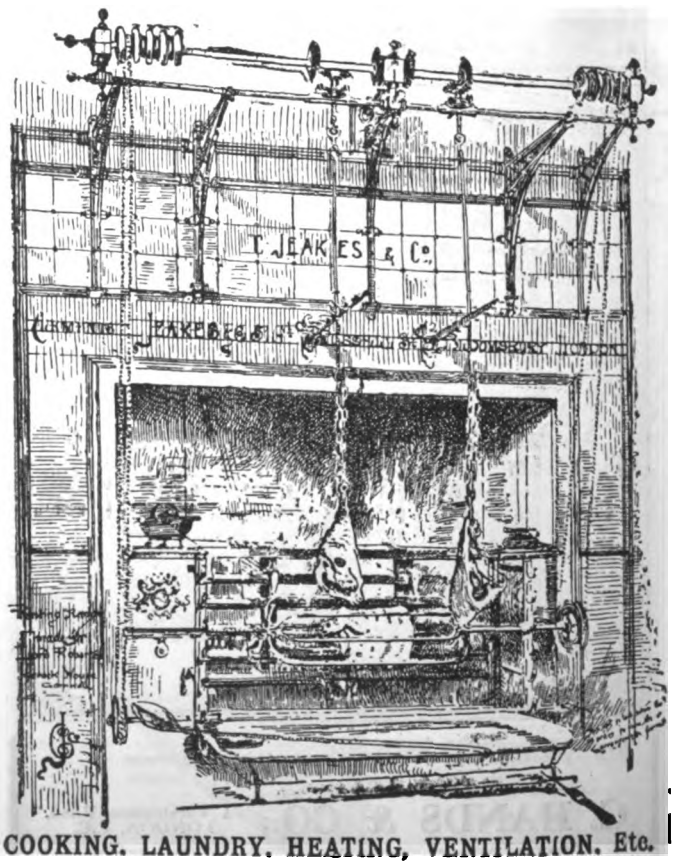
NEW CATALOGUES.

THE British Vacuum Cleaner Company seem to have installed their appliances in all the principal hotels, theatres, and shops, not to mention in Buckingham Palace, the Houses of Parliament and the Law Courts. As a general rule the plant, consisting of filter, pump and electric motor, is worked from the basement. The iron pipes in connection with the vacuum pump are carried up in the lift shafts and provided with connections on every floor. Flexible tubes are connected up to these points, the tubes being of sufficient length to reach every room on any particular floor. But the company have now thought of the multitudes of householders who do not require a plant on such a scale, but who prefer to be independent of house cleaning by contract. They have perfected a portable vacuum which runs on three broad rubber wheels, and can be connected with any electric light fixture, and only requires one person to work it.



The 1909 catalogue of Messrs. Norton & Gregory, Ltd., Castle Lane, Westminster, S.W., and Glasgow, clearly shows how completely the firm meets the widely differing requirements of technical offices. Section I. deals with surveying instruments, and includes improvements which are shown for the first time, such as solid uprights for theodolites. Section II. devotes sixty pages to drawing instruments and appliances of the best quality, from pins to roller-bearing cabinets. The third and last section gives the accessories which form so important a part of office work whether it be the pencil, the indiarubber, the drawing paper, and even the office chairs. It also gives explanatory notes upon the firm's own drawing and tracing offices and plant for lithography and photo-lithography, camera work, modelling, typewriting and other aids to relieve principals from much worry and trouble. Messrs. Norton & Gregory make it their business to provide for, if not to anticipate, the special needs of their clients, and their efforts continue to enjoy an ever-increasing appreciation.

The United Kingdom Fireproofing Company, Ltd., have produced a catalogue that is striking in many respects, most particularly for its directness. The compiler apparently set himself to say all that he has to say in the fewest possible words. A brief introduction is followed by illustrations and short descriptions of the seven systems employed by the company. This is cunningly arranged, for they are set out in the centre of separate sheets with wide margins on both sides and top and bottom. The consequent impression of spaciousness is in marked contrast to that conveyed by the generality of catalogues issued by similar companies, which are calculated to daunt any but the most courageous. Six out of their seven floors are hollow; in these reinforced concrete beams are introduced at intervals, between which are placed concrete tubes, or terra-cotta lintels, or terra-cotta tubes, or (when very deep girders are employed) separate ceiling plates and cover plates. For these hollow floors no centering is required, which is a highly important feature. The weight of the U.K. floor is about half that of a solid concrete floor, thereby reducing the quantity of steelwork. There is no loss in strength, for in the first public test a floor 24 feet by 12 feet and 12 inches in thickness, consisting of hollow concrete tubes, supported on ferro concrete beams without any steel joists, withstood a load exceeding 161,000 lb., this being equal to 560 lb. a square foot, or 6.6 times the load for which it was intended. Other subsequent tests have proved no less satisfactory. The centre of the tubes may be utilised for pipes, &c., as was done in the chemical laboratory at Cambridge where they served for air ducts to the radiators, for cable trenches, &c. The catalogue gives photographs of various works, and mentions which particular system was employed and any particular points of interest. It concludes with reproductions of some working drawings of a few of their contracts, including a storage tank, swimming bath, cattle market, and water tower.

The Reiss patent system of natural ventilation has been brought to this country and manufactured in Birmingham by Mr. W. S. Vellinghausen, who purchased the British patent rights. The Reiss ventilator consists of a rectangular underframe or base, and one or two hood-shaped lifting frames overlapping each other. These iron frames, which are connected by a system of lifting levers or expanding trellis work, open uniformly on both sides, and lift very high, forming, in conjunction with the base, a shaft into which the foul air, &c., enters. It is claimed that by this means (whichever way the wind is) a constant movement of the air in the inside of the apparatus is produced since the outer air carrying off the inner air brings about an absorbing effect. The Krupp Works at Essen have over 400 of these ventilators.

ENTRANCE DOORS AND SCREEN. Executed by HOFLER, LTD.
CHAS. FITZROY DOLL, ESQ., F.R.I.B.A., Architect.

Two or three years ago, in the course of a paper read before the Royal Institute of British Architects, mention was made of the difficulty carvers continually meet with in connection with architects' indications of carving, which are often rough sketches by a junior. The architect himself merely marks on his drawing the word "carving." Unfortunately the carver feels compelled to follow out the rough outline given, whether it be bad or good. That carvers can produce excellent work, and that their work is deserving of every encouragement and assistance, is shown in the illustrated list just issued by Messrs. Hofler, Ltd., and especially in the photographs of some of the ecclesiastical work carried out by them. The firm undertake to reproduce details and designs furnished by their clients, carefully, and with the utmost fidelity. We illustrate as a specimen of their work the entrance doors of the Imperial Hotel, Russell Square. The first half of the list shows some of the designs for Austrian oak panelling and chimney pieces. Messrs. Hofler emphasize the fact that all their panelling is properly framed up out of solid 1 inch Austrian oak, and that no veneered or 3-ply panels are used. Moreover, the panelling is specially constructed to plan, so as to fit the position it is intended to occupy, without extra charge. The prices vary considerably in accordance with the difficulty of the carving. The oak chimney pieces offer a wide selection of pleasing designs.

Some excellent advice is given by Messrs. Revy, Phillips & Co., Ltd., in the introduction to sectional catalogue C1, Cooking Apparatus. It is stated for instance that a well-made apparatus of average weight will easily last four or five

times as long as a cheap article; the aim of the company is not to submit articles at low prices, but appliances of thoroughly reliable design and quality at a reasonable figure. Stress is laid on the importance of fixing and setting being entrusted to none but an experienced contractor, or left to the company to do. It is also important to note the warning that many stoves and ranges have been ruined by being fired too severely at first. The catalogue illustrates the appliances that are now manufactured to aid the chef, such as central kitcheners, roasting ovens, carving tables, steam chests, grills, and toasters. In addition it shows numerous aids to cooking on a small as well as a large scale. Messrs. Revy, Phillips & Co., Ltd., are, it should be added, general, electrical and heating engineers; their cooking apparatus being only one department.

Messrs. R. Waygood & Co., Ltd., were the first British manufacturers to produce lifts worked by electric current. Their latest catalogue shows to what a diversity of uses they are now put. At Lisbon the company have installed a double-cage electric lift at the Santa Justa tramway station, for carrying passengers from the town to the level of the tramway at the top. The lift is constructed to raise a load of 4,500 lb. in each cage, and the height of travel is 105 feet. The cages are about 10 feet square by 7 feet 10 inches high, and the lift is capable of raising the full load at a speed of 280 feet per minute. The lifts are fitted in an ornamental iron structure, and were manufactured in the Falmouth Road works, and erected by Messrs. Waygood's men on the site. Quite different are two passenger lifts fitted for the Bournemouth Corporation to carry passengers from the cliff level to the new Marine Drive. The Ramsgate cliff lift, which was opened in July last year, makes a perpendicular ascent in a brick shaft. A special lift is made for motor-cars, with large platforms and gears of extra strength. But it is for passenger, goods and service lifts that Messrs. R. Waygood & Co., Ltd., are universally known. The company have installed them in Buckingham Palace, St. James's Palace, the new War Office, Gaiety Restaurant, numerous liners, and other places where personal comfort is a first consideration.

"Standard Steel Construction," compiled by Messrs. Hall & Pickles, iron and steel merchants, Manchester, is something more than a trade catalogue. The purpose of this well-bound and well-printed book is thus described:—"As a decided want exists of a section book which deals not only with the properties of individual sections, but shows at a glance their values in different combinations, and without loss of time enables a selection to be made of the combination best suited to the case in point, we have compiled these tables." The section book is divided into three parts giving the property tables, beam tables, and strut tables of sections. The volume concludes with a table of beam loading factors. Two plates are given; the first is for determining at a glance the shearing force in tons that a given web will safely sustain without the use of stiffeners; the second is a linen chart which shows the economical values of different types of stanchions. "Standard Steel Construction" has now reached its third edition. It may confidently be anticipated that the demands of architects, engineers and contractors, for whom it is compiled, will quickly render necessary the publication of further editions.

"To and Fro Route Directory" is a new monthly that, unlike most new periodicals, meets requirements that have never been met before. It shows "how to go from anywhere to anywhere in London," the area embraced being roughly from the Isle of Dogs to Hammersmith, and from Hampstead Heath to Deptford. It is a wonderful publication and a marvel of painstaking labour carried out on a clearly defined system. There are no doubt some small inaccuracies, as was inevitable in the initial issue, but the compilers invite corrections, and will no doubt make each successive monthly issue more and more accurate. The first part is the street directory (seemingly every street in the area comprised is given); Part 2 is a location directory, giving the leading shops, theatres, museums, businesses, baths, &c. There must be some difficulty in selection, for there are sixteen architects, thirty-two builders and ten contractors. Part 3 is the route directory, in which the directions show the quickest route from point to point, mentioning, if necessary, the train, tube, tram, 'bus and motor-'bus. It is published by Messrs. Simpkin & Marshall at 6*d*.
